Read operation instructions first.

- Observe safety instructions.

Purpose of the document:
This document contains information for the commissioning, operation and maintenance staff. It is intended to support local device operation and setting modifications.

Reference documents:
- Operation instructions (Assembly, operation, commissioning) for actuator.

Reference documents can be downloaded from the Internet (www.auma.com) or ordered directly from AUMA (refer to <Addresses>).

1. Safety instructions

1.1. Basic information on safety

Standards/directives

AUMA products are designed and manufactured in compliance with recognised standards and directives. This is certified in a Declaration of Incorporation and an EC Declaration of Conformity.

The end user or the contractor must ensure that all legal requirements, directives, guidelines, national regulations and recommendations with respect to assembly, electrical connection, commissioning and operation are met at the place of installation.

They include among others:

- Standards and directives such as: EN 60079 “Electrical apparatus for explosive gas atmospheres” –
  - Part 14: Electrical installations in hazardous areas (other than mines).
  - Part 17: Inspection and maintenance of electrical installations in hazardous areas (other than mines).

Safety instructions/warnings

All personnel working with this device must be familiar with the safety and warning instructions in this manual and observe the instructions given. Safety instructions and warning signs on the device must be observed to avoid personal injury or property damage.

Qualification of staff

Assembly, electrical connection, commissioning, operation, and maintenance must be carried out exclusively by suitably qualified personnel having been authorised by the end user or contractor of the plant only.

Prior to working on this product, the staff must have thoroughly read and understood these instructions and, furthermore, know and observe officially recognised rules regarding occupational health and safety.

Work performed in potentially explosive atmospheres is subject to special regulations which have to be observed. The end user or contractor of the plant are responsible for respect and control of these regulations, standards, and laws.

Commissioning

Prior to commissioning, it is important to check that all settings meet the requirements of the application. Incorrect settings might present a danger to the application, e.g. cause damage to the valve or the installation. The manufacturer will not be held liable for any consequential damage. Such risk lies entirely with the user.

Operation

Prerequisites for safe and smooth operation:

- Correct transport, proper storage, mounting and installation, as well as careful commissioning.
- Only operate the device if it is in perfect condition while observing these instructions.
- Immediately report any faults and damage and allow for corrective measures.
- Observe recognised rules for occupational health and safety.
- Observe the national regulations.

Protective measures

The end user or the contractor are responsible for implementing required protective measures on site, such as enclosures, barriers, or personal protective equipment for the staff.

Maintenance

Any device modification requires the consent of the manufacturer.

1.2. Range of application

AUMA actuator controls are exclusively designed for the operation of AUMA actuators.

Other applications require explicit (written) confirmation by the manufacturer. The following applications are not permitted, e.g.:

- motor control
- pump control

No liability can be assumed for inappropriate or unintended use.
Observance of these operation instructions is considered as part of the device's designated use.

### 1.3. Warnings and notes

The following warnings draw special attention to safety-relevant procedures in these operation instructions, each marked by the appropriate signal word (DANGER, WARNING, CAUTION, NOTICE).

- **DANGER**
  - Indicates an imminently hazardous situation with a high level of risk. Failure to observe this warning could result in death or serious injury.

- **WARNING**
  - Indicates a potentially hazardous situation with a medium level of risk. Failure to observe this warning could result in death or serious injury.

- **CAUTION**
  - Indicates a potentially hazardous situation with a low level of risk. Failure to observe this warning may result in minor or moderate injury. May also be used with property damage.

- **NOTICE**
  - Potentially hazardous situation. Failure to observe this warning may result in property damage. Is not used for personal injury.

#### Arrangement and typographic structure of the warnings

- **DANGER**
  - Type of hazard and respective source!
  - *Potential consequence(s) in case of non-observance (option)*
  - → Measures to avoid the danger
  - → Further measure(s)

Safety alert symbol ▼ warns of a potential personal injury hazard. The signal word (here: DANGER) indicates the level of hazard.

### 1.4. References and symbols

The following references and symbols are used in these instructions:

- **Information**
  - The term **Information** preceding the text indicates important notes and information.
  - ❯ Symbol for CLOSED (valve closed)
  - ⟲ Symbol for OPEN (valve open)
  - 🔴 Important information before the next step. This symbol indicates what is required for the next step or what has to be prepared or observed.
  - ▶ Via the menu to parameter
    - Describes the path within the menu to the parameter. By using the push buttons of the local controls you may quickly find the desired parameter in the display.
  - < > Reference to other sections
    - Terms in brackets shown above refer to other sections of the document which provide further information on this topic. These terms are either listed in the index, a heading or in the table of contents and may easily be located.
2. Identification

2.1. Name plate

Each device is equipped with a name plate.

Figure 1: Arrangement of name plate

![Name plate diagram]

Descriptions

Type designation

These instructions apply to the following devices types and sizes:

Types: AC/ACExC = AUMATIC actuator controls

Size: 01.2

Versions: Intrusive and Non-Intrusive

Order number

The product can be identified using this number and the technical data as well as order-related data pertaining to the device can be requested.

Please always state this number for any product inquiries.

On the Internet at [http://www.auma.com](http://www.auma.com), we offer a service allowing authorised users to download order-related documents such as wiring diagrams and technical data (both in German and English), inspection certificates and the operation instructions when entering the order number.

Actuator controls terminal plan

Position 9 in the TPA wiring diagram: Position transmitter (actuator):

Control unit: electromechanical:

0 = Without position transmitter

A, B, J, K, L, N = Potentiometer

C, D, E, G, H, M, S = EWG/RWG (electronic position transmitter)

Control unit: electronic:

I = MWG (Magnetic limit and torque transmitter)

AUMA power class for switchgear

The switchgear used in the actuator controls (reversing contactors/thyrists) are classified according to AUMA power classes (e.g. A1, B1, ...). The power class defines the max. permissible rated power (of the motor) the switchgear has been designed for. The rated power (nominal power) of the actuator motor is indicated in kW on the motor name plate. For the assignment of the AUMA power classes to the nominal power of the motor types, refer to the separate electrical data sheets.

For switchgear without assignment to any power classes, the actuator controls name plate does not indicate the power class but the max. rated power in kW.

Data Matrix code

When registered as authorised user, you may use the AUMA Support App to scan the Data Matrix code and directly access the order-related product documents without having to enter order number or serial number.

Figure 3: Link to the App store:

2.2. Short description

Actuator controls

AUMATIC actuator controls are used to operate AUMA actuators and are supplied ready for use. The controls may be mounted directly to the actuator or separately on a wall bracket.

The functions of the AUMATIC controls include standard valve control in OPEN - CLOSE duty, positioning, process control, logging of operating data right through to diagnostic functions.

Local controls/AUMA CDT

Operation, setting, and display can be performed on site directly at the controls.

When set to local control, it is possible to
• operate the actuator via the local controls (push buttons and display) and perform settings (contents of these instructions).
• read in or out data or modify and save settings via the AUMA CDT software (accessories), using a computer (laptop or PC). The connection between computer and AUMATIC is wireless via Bluetooth interface (not included in these instructions).

Intrusive - Non-Intrusive

• Intrusive version (control unit: electromechanical):
  Limit and torque setting is performed via switches in the actuator.
• Non-Intrusive version (control unit: electronic):
  Limit and torque setting is performed via the controls, actuator and controls housings do not have to be opened. For this purpose, the actuator is equipped with an MWG (magnetic limit and torque transmitter), also supplying analogue torque feedback signals/torque indication and analogue position feedback signals/position indication.
3. Operation

Valve damage due to incorrect basic setting!

Prior to electrical operation of the actuator, the basic settings i.e. type of seating, torque and limit switching have to be completed.

3.1. Local actuator operation

Local actuator operation is performed using the push buttons of the local controls of the AC.

Figure 4: Local controls

[1] Push button for operation command in direction OPEN
[2] Push button STOP
[3] Push button for operation command in direction CLOSE
[4] Push button RESET
[5] Selector switch

Hot surfaces, e.g. possibly caused by high ambient temperatures or strong direct sunlight!

Danger of burns

Check surface temperature and wear protective gloves, if required.

The actuator can now be operated using the push buttons [1 – 3]:

- Stop actuator: Press push button STOP [2].

Information

The OPEN - CLOSE operation commands can be given either in push-to-run or in self-retaining operation mode. For further information, please refer to <Push-to-run operation or self-retaining local> chapter.
3.2. Actuator operation from remote

→ Set selector switch to position Remote control (REMOTE).

Now, it is possible to operate the actuator via remote control, via operation commands (OPEN, STOP, CLOSE) or analogue setpoints (e.g. 0 – 20 mA).

**Information**

For actuators equipped with a positioner, it is possible to change over between OPEN - CLOSE control (Remote OPEN-CLOSE) and setpoint control (Remote SET-POINT). For further information, refer to chapter <Change-over between OPEN - CLOSE control and setpoint control>.

3.3. Menu navigation via push buttons (for settings and indications)

Menu navigation for display and setting is made via the push buttons [1 – 4] of the local controls.

Set the selector switch [5] to position 0 (OFF) when navigating through the menu.

The bottom row of the display [6] serves as navigation support and explains which push buttons [1 – 4] are used for menu navigation.

Figure 5:

Table 3: Important push button functions for menu navigation

<table>
<thead>

</tr>
</tbody>
</table>
### 3.3.1. Menu layout and navigation

#### Groups
The indications on the display are divided into 3 groups:

<table>
<thead>
<tr>
<th>Group</th>
<th>Description</th>
<th>ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>[1]</td>
<td>Startup menu</td>
<td>S</td>
</tr>
<tr>
<td>[2]</td>
<td>Status menu</td>
<td>M</td>
</tr>
<tr>
<td>[3]</td>
<td>Main menu</td>
<td>M</td>
</tr>
</tbody>
</table>

#### ID
Status menu and main menu are marked with an ID.

#### Group selection
It is possible to select between status menu \( S \) and main menu \( M \):

- For this, set selector switch to 0 (OFF), hold down push button C for approx. 2 seconds until a screen containing the ID \( M\ldots \) appears.

#### Direct display via ID
When entering the ID within the main menu, screens can be displayed directly (without clicking through).

---

**Push buttons**

<table>
<thead>

<td>Enter Main menu</td>
</tr>
<tr>
<td></td>
<td>Esc</td>
<td>Cancel process</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Return to previous display</td>
</tr>
</tbody>
</table>

**Backlight**
- The display is illuminated in white during normal operation. The backlight turns to red under fault conditions.
- The screen illumination is brighter when operating a push button. If no push button is operated for 60 seconds, the display will become dim again.
3.4. User level, password

User level

The user level defines which menu items or parameters can be displayed or modified by the active user.

There are 6 different user levels. The user level is indicated in the top row:

![User level display (example)](image)

Password

A password must be entered to allow parameter modification. The display indicates: Password 0***

A specific password is assigned to each user level and permits different actions.

Table 4: User levels and authorisations

<table>
<thead>
<tr>

3.4.1. Password entry

1. Select desired menu and hold down push button  left for approx. 3 seconds.
   ➞ Display indicates the set user level, e.g Observer (1)
2. Press  Up to select a higher user level and press  left Ok to confirm.
   ➞ Display shows: Password 0***
3. Use push buttons  Up Down to select figures 0 to 9.
4. Confirm first digit of password via push button  left Ok.
5. Repeat steps 2 and 3 for all further digits.
   ➞ Having confirmed the last digit with  left Ok, access to all parameters within one user level is possible if the password entry is correct.
3.4.2. Password change

Only the passwords of same or lower user level may be changed.

Example: The user is signed in as Specialist (4). This authorises him or her to modify the passwords between user levels (1) to (4).

M ▶ Device configuration M0053
Service functions M0222
Change passwords M0229

Menu point Service functions M0222 is only visible if user level has been set to Specialist (4) or higher.

Select main menu
1. Set selector switch to position 0 (OFF).

Change passwords
2. Press push button C Setup and hold it down for approx. 3 seconds.
   ➤ Display goes to main menu and indicates: ▶ Display...

3. Select parameter Change passwords either:
   → click via the menu M ▶ to parameter, or
   → via direct display: press ▲ and enter ID M0229
   - Display indicates: ▶ Change passwords
   - The user level is indicated in the top row (1 – 6), e.g.:

   - For user level 1 (view only), passwords cannot be changed. To change passwords, you must change to a higher user level. For this, enter a password via a parameter.

4. For a user level between 2 and 6: Press push button ✅ Ok.
   ➤ The display indicates the highest user level, e.g.: For user 4

5. Select user level via push buttons ▲ Up ▼ Down and confirm with ✅ Ok.
   ➤ Display indicates: ▶ Change passwords Password 0***

6. Enter current password (→ enter password).
   ➤ Display indicates: ▶ Change passwords Password (new) 0***

7. Enter new password (→ enter password).
   ➤ Display indicates: ▶ Change passwords For user 4 (example)

8. Select next user level via push buttons ▲ Up ▼ Down or cancel the process via Esc.

3.5. Language in the display

The AUMATIC display is multilingual.

3.5.1. Language change

M ▶ Display... M0009
Language M0049

Select main menu
1. Set selector switch to position 0 (OFF).
2. Press push button C Setup and hold it down for approx. 3 seconds.
   ➤ Display goes to main menu and indicates: ▶ Display...

   **Change language**

3. Press OK.
   ➤ Display indicates: ▶ Language
4. Press OK.
   ➤ Display indicates the selected language, e.g.: ▶ Deutsch
5. The bottom row of the display indicates:
   → Save → continue with step 10
   → Edit → continue with step 6
   ➤ Display indicates: ▶ Observer (1)
7. Select user level via Up▲ Down▼ resulting in the following significations:
   → black triangle: ⬤ = current setting
   → white triangle: ▷ = selection (not saved yet)
8. Press OK.
   ➤ Display indicates: Password 0***
9. Enter password (→ enter password).
   ➤ Display indicates: ▶ Language and Save (bottom row)

   **Language selection**

10. Select new language via Up▲ Down▼ resulting in the following significations:
    → black triangle: ⬤ = current setting
    → white triangle: ▷ = selection (not saved yet)
11. Confirm selection via OK.
    ➤ The display changes to the new language. The new language selection is saved.
4. Indications

4.1. Indications during commissioning

**LED test**
When switching on the power supply, all LEDs on the local controls illuminate for approx. 1 second. This optical feedback indicates that the voltage supply is connected to the controls and all LEDs are operable.

Figure 11: LED test

**Language selection**
During the self-test, the language selection can be activated so that the selected language is immediately indicated in the display. For this, set selector switch [5] to position 0 (OFF).

**Activate language selection:**
1. Display indicates in the bottom row: Language selection menu? ‘Reset’
2. Press push button RESET and hold it down until the following text is displayed in the bottom line: Language menu loading, please wait.

Figure 12: Self-test

The language selection menu follows the startup menu.

**Startup menu**
The current firmware version is displayed during the startup procedure:

Figure 13: Startup menu with firmware version: 04.00.00–xxxx

If the language selection feature has been activated during the self-test, the menu for selecting the display language will now be indicated. For further information on language setting, please refer to chapter <Language in the display>.

Figure 14: Language selection

If no entry is made over a longer period of time (approx. 1 minute), the display automatically returns to the first status indication.

4.2. Indications in the display

**Status bar**
The status bar (first row in the display) indicates the operation mode [1], the presence of an error [2] and the ID number [3] of the current display indication.
Figure 15: Information in the status bar (top)

[1] Operation mode
[2] Error symbol (only for faults and warnings)
[3] ID number: S = Status page

Navigation support
If further details or information are available with reference to the display, the following indications Details or More appear in the navigation support (bottom display row). Then, further information can be displayed via the push button.

Figure 16: Navigation support (bottom)

[1] shows list with detailed indications
[2] shows further available information

The navigation support (bottom row) is faded out after approx. 3 seconds. Press any push button (selector switch in position OFF) to fade in the navigation support.

4.2.1. Feedback indications from actuator and valve

Display indications depend on the actuator version.

Valve position (S0001)
This indication is only available if a position transmitter (potentiometer, EWG, RWG or MWG) is installed in the actuator.

- S0001 on the display indicates the valve position in % of the travel.
- The bargraph display appears after approx. 3 seconds.
- When issuing an operation command, an arrow indicates the direction (OPEN/CLOSE).

Figure 17: Valve position and direction of operation

Reaching the preset end positions is additionally indicated via (CLOSED) and (OPEN) symbols.

Figure 18: End position CLOSED/OPEN reached

0% Actuator is in end position CLOSED
100% Actuator is in end position OPEN
**Torque (S0002)**

The indication is only available if the actuator is equipped with an MWG (magnetic limit and torque transmitter).

- **S0002** on the display indicates the torque applied at the actuator output.
- The bargraph display appears after approx. 3 seconds.

Figure 19: Torque

**Select unit**

The push button allows to select the unit displayed (percent %, Newton metre Nm or “foot-pound” ft-lb).

Figure 20: Units of torque

**Display in percent**

100 % indication equals the max. torque indicated on the name plate of the actuator.

Example: SA 07.6 with 20 – 60 Nm.

- 100 % corresponds to 60 Nm of nominal torque.
- 50 % corresponds to 30 Nm of nominal torque.

**Operation commands (S0003)**

The display S0003 indicates:

- active operation commands, like e.g.: Operation in direction CLOSE or in direction OPEN
- the actual value E2 as bargraph indication and as value between 0 and 100 %.
- for setpoint control (positioner): setpoint E1
- for stepping mode or for intermediate positions with operation profile: pivot points and operation behaviour of pivot points

The navigation support (bottom row) is faded out after approx. 3 seconds and the axes/axes for pivot point display are shown.

**OPEN - CLOSE control**

Active operation commands (OPEN, CLOSE, ...) are shown above the bargraph display. The figure below shows the operation command in direction CLOSE.

Figure 21: Display for OPEN - CLOSE control
**Setpoint control**

If the positioner is enabled and activated, the bargraph indication for E1 (position setpoint) is displayed.

The direction of the operation command is displayed by an arrow above the bargraph indication. The figure below shows the operation command in direction CLOSE.

Figure 22: Indication for setpoint control (positioner)

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Pivot point (intermediate position) with operation profile</th>

</tr>
<tr>
<td></td>
<td>Pause for operation in directions OPEN and CLOSE</td>
<td>–</td>
</tr>
</tbody>
</table>

**Pivot point axis**

The pivot points and their operation behaviour (operation profile) are shown on the pivot point axis by means of symbols.

The symbols are only displayed if at least one of the following functions is activated:

- **Operation profile M0294**
- **Timer CLOSE M0156**
- **Timer OPEN M0206**

Figure 23: Examples: on the left pivot points (intermediate positions); on the right stepping mode

**Multiport valve positions (S0017)**

In case of active multiport valve function, the display S0017 indicates a second bargraph display with set positions (valve connections) above the actual position value E2. Positions (P1, P2, ...) are displayed with a black triangle ▼. Push buttons ▲▼ are used to select positions. Both positions and the actual position value E2 are displayed in degrees.
4.2.2. Status indications according to AUMA classification

These indications are available if the parameter Diagnostic classific.: M0539 is set to AUMA.

**Warnings (S0005)**

If a warning has occurred, the display shows S0005:
- the number of warnings occurred
- a blinking question mark after approx. 3 seconds

**Not ready REMOTE (S0006)**

The S0006 display shows indications of the Not ready REMOTE group.

If such an indication has occurred, the display shows S0006:
- the number of indications occurred
- a blinking crossbar after approx. 3 seconds

**Fault (S0007)**

If a fault has occurred, the display shows S0007:
- the number of faults occurred
- a blinking exclamation mark after approx. 3 seconds
4.2.3. Status indications according to NAMUR recommendation

These indications are available, if the parameter Diagnostic classific. M0539 is set to NAMUR.

Out of Specification (S0008)

The S0008 indication shows out of specification indications according to NAMUR recommendation NE 107.

If such an indication has occurred, the display shows S0008:
- the number of indications occurred
- a blinking triangle with question mark after approx. 3 seconds

Function check (S0009)

The S0009 indication shows function check indications according to NAMUR recommendation NE 107.

If an indication has occurred via the function check, the display shows S0009:
- the number of indications occurred
- a blinking triangle with a spanner after approx. 3 seconds

Maintenance required (S0010)

The S0010 indication shows maintenance indications according to NAMUR recommendation NE 107.

If such an indication has occurred, the display shows S0010:
- the number of indications occurred
- a blinking square with an oil can after approx. 3 seconds
Failure (S0011)

The S0011 indication shows the causes of the failure indication according to NAMUR recommendation NE 107.

If such an indication has occurred, the display shows S0011:
- the number of indications occurred
- a blinking circle with a cross after approx. 3 seconds

**Modify indication light assignment (indications)**

Different indications can be assigned to LEDs 1 – 5.

<table>

User level required to make changes: AUMA (6)
5. Signals (output signals)

5.1. Status signals via output contacts (digital outputs)

Characteristics
Output contacts are used to send status signals (e.g. reaching the end positions, selector switch position, faults...) as binary signals to the control room.
Status signals only have two states: active or inactive. Active means that the conditions for the signal are fulfilled.

5.1.1. Assignment of outputs
The output contacts (outputs DOUT 1 – 12) can be assigned to various signals.
Required user level: Specialist (4) or higher.

M ▶ Device configuration M0053
I/O interface M0139
Digital outputs M0110
Signal DOUT 1 M0109

Default values:
Signal DOUT 1 = Fault
Signal DOUT 2 = End position CLOSED
Signal DOUT 3 = End position OPEN
Signal DOUT 4 = Selector sw. REMOTE
Signal DOUT 5 = Torque fault CLOSE
Signal DOUT 6 = Torque fault OPEN
Signal DOUT 7 = End position CLOSED
Signal DOUT 8 = End position OPEN
Signal DOUT 9 = Selector sw. REMOTE
Signal DOUT 10 = Torque fault CLOSE
Signal DOUT 11 = Torque fault OPEN
Signal DOUT 12 = Fault

Further setting values:
Refer to <Appendix>/<Selection overview for output contacts and indication lights>

5.1.2. Coding the outputs
The output signals DOUT 1 – 12 can be set either to high active or low active.

- High active = output contact closed = signal active
- Low active = output contact open = signal active

Required user level: Specialist (4) or higher.

M ▶ Device configuration M0053
I/O interface M0139
Digital outputs M0110
Coding DOUT 1 M0102

Default values for DOUT 1 – 12: High active

5.2. Configurable status signals
The signals described here are collective signals of various other signals which can be configured for specific users. For configuration, the individual signals can be selected from a list and activated (☑) or deactivated (☐) individually. The signals can either be assigned to a digital output (output contact) or to an indication light (LED).

For detailed information on these signals, refer to <Fault signals and warnings> chapter.

Configure status signals

Required user level: Specialist (4) or higher.
Device configuration M0053
Config. of signals M0860
Failure (configurable) M0879
Fault (Cfg) M0880
Warnings (Cfg) M0881
Not ready REMOTE (Cfg) M0882

Default values Failure (configurable):
☑ = activated
☑ Fault (Cfg)
☑ Warning (Cfg)
☑ Not ready REMOTE (Cfg)

Default values Fault (Cfg):
☑ = activated
☑ Configuration error
☑ Config. error REMOTE
☑ Internal error
☑ Torque fault CLOSE
☑ Torque fault OPEN
☑ Phase fault
☑ Incorrect phase seq
☑ Mains quality
☑ Thermal fault
☑ Fault no reaction

Default values Warnings (Cfg):
☑ = activated
☑ Config. warning
☑ Internal warning
☑ Wm input AIN 1
☑ Wm input AIN 2
☑ Wm setpoint position
☑ Not used
☑ Maintenance required

Default values Not ready REMOTE (Cfg):
☑ = activated
☑ Wrong oper. cmd
☑ Sel. sw. not REMOTE
☑ Service active
☑ Disabled
☑ EMCY stop active
☑ EMCY behav. active
☑ I/O interface
☑ Handwheel active
☑ FailState fieldbus
☑ Local STOP
5.3. Analogue signals (analogue outputs)

**Conditions**
The actuator is equipped with a position transmitter.

**Characteristics**
Depending on the actuator equipment, different signals, such as travel, torque or output speed can be recorded and issued as continuous values, e.g. 4 to 20 mA. The AC is equipped with up to two analogue outputs AOUT1 and AOUT2.

### 5.3.1. Assignment of analogue output 1

Designation in the wiring diagram: AOUT 1.

Required user level: AUMA (6).

**Device configuration M0053**

**I/O interface M0139**

**Analogue outputs M0335**

**Signal AOUT 1 M0131**

**Default value:** Actual position

**Information**
The signal range of the output (e.g. 0/4 – 20 mA) is set via a separate parameter (Signal range AOUT1 M0129).

**Setting values:**

- **Not used**
  Analogue output 1 is not assigned.

- **Actual position**
  Position feedback of the valve position (actual position value E2)
  Condition: Position transmitter installed in the actuator.
  An adjustment to the end positions or the defined travel is not required. An automatic adjustment is done via the end positions (LSC (WSR) and LSO (WOEL)).
  For torque seating, the end positions OPEN and CLOSED of the limit switching should be set as close as possible to the end positions of the valve to minimise the deviation of the feedback.

**Torque**
  Torque feedback E6
  Condition: MWG position transmitter in actuator.
  The zero point is in the centre of the selected output range (10 mA or 12 mA). The torque in direction CLOSE is indicated with 0 – 10 mA or 4 – 12 mA, the torque in direction OPEN with 10 – 20 mA or 12 – 20 mA. For 127% of the maximum nominal output torque, 0 or 4 mA are indicated in direction CLOSE, and 20 mA are indicated in direction OPEN.

Figure 33: Actual torque value

-127% = maximum nominal torque in end position CLOSED reached

+127% = maximum nominal torque in end position OPEN reached

**Input AIN 1**
Analogue value transmitted via AIN1 (refer to wiring diagram) to the actuator.
Condition: An analogue signal (e.g. 0 – 20 mA) is connected to the analogue input AIN 1.

**Input AIN 2**
Analogue value transmitted via AIN 2 (refer to wiring diagram) to the actuator.
Condition: An analogue signal (e.g. 0 – 20 mA) is connected to the analogue input AIN 2.

| Speed target value | Actual speed value. |

### 5.3.2. Signal range of analogue output 1

Required user level: Specialist (4) or higher.

#### M

- **Device configuration**: M0053
- **I/O interface**: M0139
- **Analogue outputs**: M0335
- **Signal range AOUT1**: M0129

| Default value: 0 - 20 mA |

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>0 - 20 mA</td>
</tr>
<tr>
<td>4 - 20 mA</td>
</tr>
<tr>
<td>20 - 0 mA</td>
</tr>
<tr>
<td>20 - 4 mA</td>
</tr>
</tbody>
</table>

### 5.3.3. Adjustment of analogue output 1

The initial values and end values of the signal range can be corrected by ± 1 mA.

Example: Parameter **Signal range AOUT1** = 4 - 20 mA

The initial value (4 mA) can be adapted within a range of 3 mA to 5 mA.

The end value (20 mA) can be adapted within a range of 19 mA to 21 mA.

Required user level: Specialist (4) or higher.

#### M

- **Device configuration**: M0053
- **I/O interface**: M0139
- **Analogue outputs**: M0335
- **Adjustment AOUT1**: M0544
- **0/4 mA (initial value)**: M0140
- **20 mA (final value)**: M0210

| Default value: 0 |

<table>
<thead>
<tr>
<th>Setting ranges:</th>
</tr>
</thead>
<tbody>
<tr>
<td>=100 ... 100 (− 1.00 to + 1.00 mA)</td>
</tr>
</tbody>
</table>

### 5.3.4. Assignment of analogue output 2

Designation in the wiring diagram: AOUT2.

Required user level: AUMA (6).

#### M

- **Device configuration**: M0053
- **I/O interface**: M0139
- **Analogue outputs**: M0335
- **Signal AOUT2**: M0132

| Default value: Torque |

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Description see &lt;Assignment of analogue output 1&gt;.</td>
</tr>
</tbody>
</table>

### 5.3.5. Signal range of analogue output 2

Required user level: Specialist (4) or higher.

#### M

- **Device configuration**: M0053
- **I/O interface**: M0139
- **Analogue outputs**: M0335
- **Signal range AOUT2**: M0130
5.3.6. Adjustment of analogue output 2

Initial values and end values of the signal range can be corrected by ± 1 mA.

Example: Parameter Signal range AOUT1 = 4 – 20 mA

The initial value (4 mA) can be adapted within a range of 3 mA to 5 mA.
The end value (20 mA) can be adapted within a range of 19 mA to 21 mA.

Required user level: Specialist (4) or higher.

Default values: 0

Setting ranges: –100 ... 100 (–1.00 to +1.00 mA)
6. Operation

Different operation modes (states) are available. The current operation mode is indicated in the first line of the display:

Figure 34: Example: Operation mode Off

This chapter describes the characteristics of the different operation modes; the respective functions are described in separate chapters.

6.1. Operation mode Off

The selector switch is in position 0 (OFF).

Characteristics
- The indication in the top row of the display shows: Off
- Electric operation is not possible (not even EMERGENCY operation).
- The controls remain fully operative as far as signalling is concerned (controls' power supply is maintained).
- Push buttons ▲▼⇔C can be used for menu navigation via the display.

6.2. Operation mode Local

Selector switch is in position Local control (LOCAL).

Characteristics
- The indication in the top row of the display shows: Local
- In motor operation, the actuator can be controlled locally via the push buttons ▲ (OPEN), STOP ☐ (CLOSE).
- Faults and warnings without automatic reset can be confirmed with the push button RESET.

6.2.1. Push-to-run operation or self-retaining Local

Parameter Self-retaining Local M0076 determines the actuator operation behaviour to operation commands via push buttons on local controls.

Customer settings M0041
Local controls M0075
Self-retaining Local M0076

Default value: OPEN and CLOSE

Setting values:
- Off (push-to-run op.): Push-to-run operation activated, self-retaining off:
  Actuator only runs in direction OPEN or CLOSE while an operation command is being received. The actuator stops if the operation command is cancelled.
- OPEN: In direction OPEN = self-retaining (in direction CLOSE push-to-run operation):
  After an operation command in direction OPEN, the actuator continues to run, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if end position OPEN or an intermediate position OPEN has been reached.
- CLOSE: In direction CLOSE = self-retaining (in direction OPEN push-to-run operation):
After an operation command in direction CLOSE, the actuator continues to run, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if end position CLOSED or an intermediate position CLOSE has been reached.

**OPEN and CLOSE**

In directions OPEN and CLOSE = self-retaining:

After an operation command, the actuator continues to run in directions OPEN or CLOSE, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if an end position or intermediate position has been reached.

Direct reversal of operation is not possible. Operation commands in directions OPEN or CLOSE must be stopped first by STOP command. Only then is an operation command into the opposite direction allowed.

**OPEN & CL w/o STOP**

In directions OPEN and CLOSE = self-retaining without stop:

Direct reversal of operation is also possible without the STOP command. However, operation can be stopped at any time by the STOP command.

**Information**

Hold down push buttons \[ \text{OPEN} \] or \[ \text{CLOSE} \] for more than 2 seconds to activate self-retaining, press STOP to reset the operation mode to push-to-run operation.

### 6.3. Operation mode Remote

Selector switch is in position **Remote control** (REMOTE).

![Selector switch](image)

**Characteristics**

The indication in the top row of the display shows the set source of the operation commands:

- **Remote** (parallel interface)
- **Remote II** (parallel interface, push button station)

Depending on the control, a distinction is made between:

- **OPEN - CLOSE control** (operation mode Remote OPEN - CLOSE): Control is made via binary operation commands OPEN, STOP, CLOSE. (or for activated Multiport Valve function via operation commands CW, CCW)
- **Setpoint control** (operation mode Remote SETPOINT): Control via analogue operation commands, e.g. 4 – 20 mA.

**Information**

- Binary signals (e.g. +24 V DC) via digital inputs are only recognised as valid operation commands if the signal is present for at least 10 ms.
- If a positioner or process controller is available, change-over between OPEN - CLOSE control (operation mode Remote OPEN - CLOSE) and setpoint control (operation mode Remote SETPOINT) is possible. Refer to chapter «Change-over between OPEN - CLOSE control and setpoint control».

### 6.3.1. Push-to-run operation or self-retaining Remote

Parameters **Self-retaining Remote M0100**, **Self-retaining M01193** and **Self-retaining Remote II M0101** determine the actuator operation behaviour to binary operation commands (OPEN, STOP, CLOSE or CW, CCW), which control the actuator “from Remote” via I/O interface.

**Customer settings**

- **I/O interface M0015**
  - **Self-retaining Remote M0100**
  - **Self-retaining M01193**
  - **Self-retaining Remote II M0101**

**Default values:**
Self-retaining = Off (push-to-run op.)

Self-retaining Remote II = OPEN and CLOSE

Setting values for parameters, Self-retaining Remote M0100 and Self-retaining Remote II M0101:

Off (push-to-run op.)
Actuator only runs in directions OPEN or CLOSE while an operation command is being received. The actuator stops if the operation command is cancelled.

OPEN
In direction OPEN = self-retaining (in direction CLOSE push-to-run operation):
After an operation command in direction OPEN, the actuator continues to run, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if end position OPEN or an intermediate position OPEN has been reached.

CLOSE
In direction CLOSE = self-retaining (in direction OPEN push-to-run operation):
After an operation command in direction CLOSE, the actuator continues to run, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if end position CLOSED or an intermediate position CLOSED has been reached.

OPEN and CLOSE
In directions OPEN and CLOSE = self-retaining:
After an operation command, the actuator continues to run in directions OPEN or CLOSE, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if an end position or intermediate position has been reached.

Direct reversal of operation is not possible. Operation commands in directions OPEN or CLOSE must be stopped first by the STOP command. Only then is an operation command into the opposite direction allowed.

OPEN & CL w/o STOP
In directions OPEN and CLOSE = self-retaining without stop:
Direct reversal of the operation direction without STOP command is possible.
Direct reversal of operation is also possible without the STOP command. However, operation can be stopped at any time by the STOP command.

Setting values for parameter Self-retaining M01193 (for Multiport Valve function):

Off
Push-to-run operation activated, self-retaining off:
The actuator will only be operated clockwise or counterclockwise as long as an operation command (CW or CCW) is present. The actuator stops if the operation command is cancelled.

CCW
Counterclockwise (CCW) = self-retaining (clockwise = push-to-run operation):
After an operation command in CCW direction, the actuator continues to run, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if the specified MPV position has been reached.

CW
Clockwise (CW) = self-retaining (counterclockwise = push-to-run operation):
After an operation command in CW direction, the actuator continues to run, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if the specified MPV position has been reached.

CW and CCW
In both directions = self-retaining:
After an operation command (in CW or CCW direction), the actuator continues to run, even if the operation command is cancelled (self-retaining). The actuator is either stopped by the STOP command or if an MPV position has been reached.
Direct reversal of operation is not possible. Operation commands in CW or CCW directions must be stopped first by the STOP command. Only then is an operation command into the opposite direction allowed.

CW & CCW w/o STOP
In both directions = self-retaining without stop:
Direct reversal of the operation direction without STOP command is possible.
Direct reversal of operation is also possible without the STOP command. However, operation can be stopped at any time by the STOP command.

6.4. Operation mode EMERGENCY

See also: Failure function <EMERGENCY behaviour>

Characteristics
- The indication in the top row of the display shows: EMERGENCY
- The operation mode EMERGENCY is initiated by the EMERGENCY signal.
- The actuator performs an EMERGENCY operation. For example, the actuator moves to a predefined EMERGENCY position (i.e. end position OPEN or end position CLOSED).
- As long as the EMERGENCY signal is present, the actuator does not respond to any other operation commands (EMERGENCY signal has top priority).

The actuator can start immediately when switching on!
Risk of personal injuries or damage to the valve.

→ Ensure that the EMERGENCY signal is present when switching on.
→ Should the actuator start unexpectedly: Immediately set selector switch to position 0 (OFF).

6.5. Operation mode EMERGENCY stop

See also: Failure function <EMERGENCY stop function>

Condition
An EMERGENCY stop button (latching) is either located on the electrical connection or outside.

Characteristics
- The indication in the top row of the display shows: EMCY stop
- In an emergency, the EMERGENCY stop button can be used to interrupt the power supply of the motor control (contactors or thyristors).
- Operation mode EMERGENCY stop supersedes all other operation modes.
- A new operation command can only be executed once the pressed EMERGENCY stop button is released and operation mode EMERGENCY Stop is cancelled using a Reset command.
- Analogue operation commands (e.g. 0/4 – 20 mA) are immediately executed again.

6.6. Operation mode Disabled

See also: Application function <Local controls:enable>

Characteristics
- The indication in the top row of the display shows: Disabled
- The operation via the push buttons on the local controls is disabled.
- Operation mode Disabled is possible in selector switch positions LOCAL and OFF.

Table 6: Functions depending on the selector switch position:

<table>
<thead>
<tr>
<th>Selector switch in position</th>
<th>Function during indication = Disabled</th>
</tr>
</thead>
<tbody>
<tr>
<td>Local control (LOCAL)</td>
<td>Actuator cannot be operated locally</td>
</tr>
<tr>
<td>0 (OFF)</td>
<td>Local menu operation not possible</td>
</tr>
</tbody>
</table>

- The Enable Local is used for disabling or enabling via a digital input.

6.7. Operation mode Service

Conditions: Set selector switch = position Local control (LOCAL) or Remote control (REMOTE).
Display indicates in the first row: Service

Characteristics
- The indication in the top row of the display shows: Service
For operation mode service, a PC or laptop with the AUMA CDT service software is required. AUMA service uses this software (e.g. during commissioning or maintenance) to perform settings at the AUMATIC.

Information

In selector position **Local control** (LOCAL), press any push button to exit the service operation mode and to activate operation mode local.
7. Basic settings for commissioning

Definition
Basic settings such as type of seating, torque and limit switching are required for safe commissioning of the AUMATIC together with the actuator. Basic settings for display, such as date and time or display formats, can be changed, if required.

7.1. Type of seating for end positions

Function
- Selection of the type of seating (according to valve manufacturer's specifications)
  - Limit seating in end position
  - Torque seating in end position
- For end positions OPEN and CLOSE, the following can be set individually:

Limit seating
The controls switch off the actuator in the end positions (OPEN/CLOSED) set via limit switching.

For end position seating via limit switching, you have to account for the overrun of the actuator. Overrun [1] is the travel from switching off until complete standstill. The overrun depends on the inertia of both the actuator and the valve and the delay time of the controls.

Figure 35: Limit seating

Torque seating
The controls switch off the actuator in the end positions via torque switching.

For this the torque switching has to be set to the tripping torque specified by the valve manufacturer. When reaching the end position, the torque increases within the valve seat. As soon as the set tripping torque is reached, the controls automatically switch off the actuator.

In this context, the limit seating is used to signal that the limit switching will trip shortly before reaching the end position.

7.1.1. Type of seating: set

Valve damage due to incorrect setting!

→ The type of seating must suit the valve.
→ Only change the setting with the consent of the valve manufacturer.

Customer settings M0041
Type of seating M0012
End position CLOSED M0086
End position OPEN M0087

Default value: Limit

Setting values:
- Limit: Seating in end positions via limit switching.
- Torque: Seating in end positions via torque switching.
Select main menu 1. Set selector switch to position 0 (OFF).

2. Press push button C Setup and hold it down for approx. 3 seconds.
   - Display goes to main menu and indicates: ▶ Display...

Select parameter 3. Select parameter either:
   - click via the menu M ▶ to parameter, or
   - via direct display: press ▲ and enter ID M0086 or M0087
   - Display indicates: End positionCLOSED

CLOSE or OPEN 4. Use ▲▼ Up ▼ Down ▼ to select:
   - End position CLOSED
   - End position OPEN
   - The black triangle ▶ indicates the current selection.
5. Press ◄◄ Ok.
   - Display indicates the current setting: Limit or Torque
   - The bottom row of the display indicates either:
     - Edit → continue with step 6
     - Save → continue with step 10
6. Press ◄◄ Ok.
   - Display indicates: ▶ Specialist (4)

Log on user 7. Use ▲▼ Up ▼ Down ▼ to select user:
   - Information: Required user level: Specialist (4) or higher
   - The symbols have the following meaning:
     - black triangle: ▶ = current setting
     - white triangle: ▷ = selection (not saved yet)
8. Press ◄◄ Ok.
   - Display indicates: Password 0***
9. Enter password (► enter password).
   - The screen indicates the pre-set type of seating (► Limit or ► Torque) by means of a black triangle ▶.

Change settings 10. Select new setting ▲▼ Up ▼ Down ▼ resulting in the following significations:
   - The symbols have the following meaning:
     - black triangle: ▶ = current setting
     - white triangle: ▷ = selection (not saved yet)
11. Confirm selection via ◄◄ Save.
   - The setting for the type of seating is complete.

7.2. Torque switching

Conditions MWG in actuator (Non-intrusive version).
For torque switches in the actuator (Intrusive version), the torque switching is set as described in the operation instructions.

Function
- Overload protection across full travel
- Tripping in end positions (for torque seating)
- Tripping in during manual operation also possible
• Indication or setting either in percent %, Newton metre Nm or in foot-pound ft-lb

Read more: <Torque monitoring> chapter

7.2.1. Torque switching: set

Once the set torque is reached, the torque switches will be tripped (overload protection of the valve).

Information

The torque switches may also trip during manual operation.

---

**NOTICE**

Valve damage due to excessive tripping torque limit setting!

→ The tripping torque must suit the valve.

→ Only change the setting with the consent of the valve manufacturer.

---

**Select main menu**

1. Set selector switch to position 0 (OFF).

2. Press push button C Setup and hold it down for approx. 3 seconds.

   ➤ Display goes to main menu and indicates: ▶ Display...

**Select parameter**

3. Select parameter either:

   → click via the menu M ▶ to parameter, or

   → via direct display: press ▲ and enter ID M0084.

   ➤ Display indicates: Trip torque CLOSE

**CLOSE or OPEN**

4. Use ▲▼ Up ▼ Down ▼ to select:

   → ▶ Trip torque CLOSE

   → ▶ Trip torque OPEN

   ➤ The black triangle ▶ indicates the current selection.

5. Press ◀ Ok.

   ➤ Display shows the set value.

   ➤ The bottom row indicates: Edit Esc

   ➤ Display indicates:

   - Specialist (4) → continue with step 7
   - in bottom row Up ▲ Down ▼ Esc → continue with step 11

**User login**

7. Use ▲▼ Up ▼ Down ▼ to select user:

   **Information:** Required user level: Specialist (4) or higher.

   ➤ The symbols have the following meanings:

   - black triangle: ▶ = current setting
   - white triangle: ▶ = selection (not saved yet)

8. Press ◀ Ok.

   ➤ Display indicates: Password 0***
9. Enter password (→ enter password).
   ➤ Display shows the set value.
   ➤ The bottom row indicates: Edit Esc
11. Enter new value for tripping torque via ▲ Down ▼.
   Information: The adjustable torque range is shown in round brackets.
12. Save new value via Save.
   ➤ The tripping torque is set.

Information

The following fault signals are issued if the torque setting performed has been reached in mid-travel:
- In the display of the local controls: Status indication S0007 Fault Torque fault OPEN or Torque fault CLOSE

The fault has to be acknowledged before the operation can be resumed. The acknowledgement is made:

1. either by an operation command in the opposite direction.
   - For Torque fault OPEN: Operation command in direction CLOSE
   - For Torque fault CLOSE: Operation command in direction OPEN
2. or, in case the torque applied is lower than the preset tripping torque:
   - in selector switch position Local control (LOCAL) via push button RESET.
   - in selector switch position Remote control (REMOTE):
     - via a digital (I/O interface) with the Reset command if a digital input is configured for RESET signal.

7.3. Limit switching

Conditions

Electronic control unit with MWG in the actuator (non-intrusive version)

For an electro-mechanical control unit equipped with switches in the actuator (intrusive version), the limit switches are set as described in the operation instructions.

Functions

- Tripping in end positions (limit seating)
- Signalling the end positions (torque seating)

7.3.1. Limit switching: set

Valve damage at valve/gearbox due to incorrect setting!

→ When setting with motor operation: Stop actuator before reaching end of travel (press push button STOP).
→ Allow for overrun when selecting limit seating.

Customer settings

M0041
Limit switching M0010
Set end pos. CLOSED? M0084
Set end pos. OPEN? M0085

Select main menu

1. Set selector switch to position 0 (OFF).
2. Press push button C and hold it down for approx. 3 seconds.
   ➤ Display goes to main menu and indicates: Display...
Select parameter

3. Select parameter either:
   - click via the menu M ▶ to parameter, or
   - via direct display: press ▲ and enter ID M0084.

   Display indicates: Set end pos.CLOSED?

CLOSED or OPEN

4. Use ▲▼ Up ▲ Down ▼ to select:
   - ▶ Set end pos.CLOSED? M0084
   - ▶ Set end pos. OPEN? M0085

   The black triangle ▶ indicates the current selection.

5. Press ◄ Ok.

   The display indicates either:
   - Set end pos.CLOSED? CMD0009 → continue with step 9
   - Set end pos. OPEN? CMD0010 → continue with step 14
   - Specialist (4) → continue with step 6

Log on user

6. Use ▲▼ Up ▲ Down ▼ to select a user:

   Information: Required user level: Specialist (4) or higher

   The symbols have the following meaning:
   - black triangle: ▶ = current setting
   - white triangle: ▷ = selection (not saved yet)

7. Press ◄ Ok to confirm selected user level.

   Display indicates: Password 0***

8. Enter password (→ enter password).

   The display indicates either:
   - Set end pos.CLOSED? CMD0009 → continue with step 9
   - Set end pos. OPEN? CMD0010 → continue with step 14

Set end position

CLOSED CMD0009

9. Re-set end position CLOSED:

   9.1 For large strokes: Set selector switch in position Local control (LOCAL) and operate actuator in motor operation via push button T (CLOSED) in direction of the end position.

   Information: Stop actuator before reaching end of travel (press push button STOP) to avoid damage.

9.2 Engage manual operation.

9.3 Turn handwheel until valve is closed.

9.4 Turn back the handwheel by an amount equal to the overrun.

9.5 Set selector switch to position 0 (OFF).

   Display indicates: Set end pos.CLOSED? Yes No

10. Press ◄ Yes to accept new end position setting.

    Display indicates: End pos. CLOSED set!

    The left LED is illuminated (standard version) and thus indicates that the end position CLOSED setting is complete.
11. Make selection:
   → **Edit** → back to step 9: Set end position CLOSED “once again”
   → **Esc** → back to step 4; either set end position OPEN or exit the menu.

**Set end position OPEN**

CMD0010

12. Re-set end position OPEN:

12.1 For large strokes: Set selector switch in position **Local control** (LOCAL)
   and operate actuator in motor operation via push button ▶️ (OPEN) in
direction of the end position.
   **Information:** Stop actuator **before** reaching end of travel (press push
   button **STOP**) to avoid damage.

12.2 Engage manual operation.

12.3 Turn handwheel until valve is open.

12.4 Turn back the handwheel by an amount equal to the overrun.

12.5 Set selector switch to position 0 (OFF).
   ➤ Display indicates: **Set end pos. OPEN? Yes No**

13. Press ✪ Yes to accept new end position setting.
   ➤ Display indicates: **End pos. OPEN set!**
   ➤ The right LED is illuminated (standard version) and thus indicates that the end
   position setting is complete.

14. Make selection:
   → **Edit** → back to step 9: Set end position OPEN “once again”
   → **Esc** → back to step 4; either set end position CLOSED or exit the menu.

**Information** If an end position cannot be set: Check the type of control unit in actuator.

### 7.4. Date and time

After commissioning, we recommend checking and setting date and time. Date and
time are required for the event report function.

In case of a mains failure, date and time are stored. This data will only have to be
checked after a longer downtime.

**Display...** M0009

Date and time M0221

**Information**

- The date format, e.g. day/month/year, can be changed via the parameter **Date
  format** M0310.
- The time format, e.g. 12/24h can be changed via the parameter **Time format
  M0050**.

### 7.5. Display formats

The indications on the display can be represented in different formats: Country-specific
spellings, for example, can be accounted for.

#### 7.5.1. Date format

The data can be represented in day/month/year or in year/month/day.

**Display...** M0009

Date format M0310

**Default value:** DD.MM.YYYY
7.5.2. Time format

The time can be indicated in 12 or 24 hour format.

- **Display... M0009**
  - **Time format M0050**
  - **Default value: 24h**

**Setting values:**
- **12h** Indication of hour/minute/second in 12-hour format, example: 02:25:09 PM
- **24h** Indication of hour/minute/second in 24-hour format, example: 14:25:09

7.5.3. Number format

The number format determines the sign for indicating the decimal places. Either a decimal point or a decimal comma can be used to separate integral numbers and decimal places.

- **Display... M0009**
  - **Number format M0231**
  - **Default values:**
  - For English as display language = **xx.x**
  - For all other display languages = **xx, x**

**Setting values:**
- **xx.x** Indication of the decimal places using a decimal point, example: 20.0 mA
- **xx, x** Indication of the decimal places using a decimal comma, example: 20,0 mA

7.5.4. Torque unit

The torque can be indicated in different units.

- **Display... M0009**
  - **Torque unit M0051**
  - **Default value: Nm**

**Setting values:**
- **Nm** Indication in Nm
- **ft-lb** Indication in foot-pound
- **%** Indication in percent

7.5.5. Temperature unit

The temperature unit can either be displayed in Celsius [°C] or Fahrenheit [°F].

- **Display... M0009**
  - **Temperature unit M0052**
  - **Default value: °C**

**Setting range:** °C or °F

7.5.6. Position units

The valve position (e.g. actual position, target position) or other positions (e.g. pivot points) are indicated in percent of the travel on the AC display (default setting). By activating the parameter **Position**, you may select other physical units instead of percent to represent the positions. Furthermore, both scaling and maximum value...
may be adapted. The change-over affects all screens indicating a position. This includes status pages such as $S0001\ S0002$, but also the representation of characteristics (e.g. position-time) as well as histograms.

### Activate position unit

Required user level: Specialist (4) or higher.

**M ➤** Display... M0009  
Units M1205  
Position M1206  
Activation M1207

*Default value: Function not active*  
*Setting values:*  
- Function not active: <Units of position> function deactivated.  
- Function active: <Units of position> function activated.

### Set max. value, scaling and unit

Required user level: Specialist (4) or higher.

**M ➤** Display... M0009  
Units M1205  
Position M1206  
Max. value at 100.0 % M1208  
Scaling M1209  
Unit M1210

### 7.5.7. Process factor units

Process factors (e.g. process setpoint, actual process value...) are shown in percent of travel in the AC display (default setting). By activating the parameter *Process factor*, you may select other physical units instead of percent. The change-over affects all screens indicating a process value.

### Activate process factor units

Required user level: Specialist (4) or higher.

**M ➤** Display... M0009  
Units M1205  
Process factor M1211  
Activation M1212

*Default value: Function not active*  
*Setting values:*  
- Function not active: <Process factor units> deactivated.  
- Function active: <Process factor units> activated.

### Set max. value, scaling and unit

Required user level: Specialist (4) or higher.

**M ➤** Display... M0009  
Units M1205  
Process factor M1211  
Max. value at 100.0 % M1213  
Scaling M1214

7.5.8. Analogue working value units (AIN)

**Activate working value units (AIN)**

Required user level: Specialist (4) or higher.

- Display... M0009
- Units M1205
- Working values (AIN) M1216
- Activation M1217

**Default value:** Function not active

**Setting values:**

- **Function not active** <Working value units (AIN)> function deactivated.
- **Function active** <Working value units (AIN)> function activated.

**Set max. value, scaling and unit**

Required user level: Specialist (4) or higher.

- Display... M0009
- Units M1205
- Working values (AIN) M1216
- Max. value at 100.0 % M1217
- Scaling M1218
- Unit M1219

7.5.9. Analogue signal output units (AIN)

**Activate signal output units (AIN)**

Required user level: Specialist (4) or higher.

- Display... M0009
- Units M1205
- Signal outputs (AIN) M1221
- Activation M1222

**Default value:** Function not active

**Setting values:**

- **Function not active** <Signal output units (AIN)> function deactivated.
- **Function active** <Signal output units (AIN)> function activated.

**Set max. value, scaling and unit**

Required user level: Specialist (4) or higher.

- Display... M0009
- Units M1205
- Signal outputs (AIN) M1221
- Max. value at 100.0 % M1223
- Scaling M1224
- Unit M1225

7.6. Contrast

The contrast can be used to adapt the display backlight (light or dark background).

- Display... M0009
- Contrast M0230
8. **Application functions**

**Definition**  
Application functions are functions used to adapt the AC to special applications. This includes device functions, communication functions and device information. If they are enabled, these functions can be programmed by the user for his/her specific task using parameters.

### 8.1. Intermediate positions (pivot points)

— **Option** —

**Conditions**  
The actuator is equipped with a position transmitter.

**Characteristics**
- With the AC, up to 8 intermediate positions (pivot points) can be set to any value between 0 % and 100 % of the travel.
- Each intermediate position can be activated or deactivated individually.
- When reaching an intermediate position, a signal can be generated.
- A hysteresis can be defined for each pivot point.

#### 8.1.1. Intermediate positions (pivot points): define

Each intermediate position can be set to a value between 0 and 100 % of the travel.

<table>
<thead>
<tr>
<th>M</th>
<th>Customer settings</th>
<th>M0041</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Intermediate positions</td>
<td>M0143</td>
</tr>
<tr>
<td></td>
<td>Pivot points</td>
<td>M0160</td>
</tr>
<tr>
<td></td>
<td>Pivot point 1</td>
<td>M0249</td>
</tr>
</tbody>
</table>

**Default values:** 0.0 % for all 8 intermediate positions

**Setting range:** 0.0 % (CLOSED) to 100.0 % (OPEN) of the travel

**Information**  
The pivot points also apply to the <Operation profile> function.

#### 8.1.2. Signal behaviour of intermediate positions: set

Reaching a pivot point (intermediate position) can be signalled:
- via indication lights (LEDs) of the local controls or
- via output contacts

Each pivot point (intermediate position) can be assigned a specific signal behaviour.

<table>
<thead>
<tr>
<th>M</th>
<th>Customer settings</th>
<th>M041</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Intermediate positions</td>
<td>M0143</td>
</tr>
<tr>
<td></td>
<td>Signal behaviour</td>
<td>M0266</td>
</tr>
<tr>
<td></td>
<td>Signal behaviour 1</td>
<td>M0269</td>
</tr>
</tbody>
</table>

**Default value:** No signal

**Setting values:**

- **No signal**  
  Behaviour A: "Off", intermediate position is not signalled.

- **C________|¯¯¯¯¯¯¯¯O**  
  Behaviour B: Signal is active from reaching the pivot point (P) up to end position OPEN (100 %).

- **C¯¯¯¯¯¯¯¯¯|_______O**  
  Behaviour C: Signal is active from end position CLOSED (0 %) until reaching the pivot point (P).

- **C_______|¯|_______O**  
  Behaviour D: When passing the pivot point (P), a pulse signal is issued.
Figure 36: Signal behaviour (A to D) of the intermediate positions

Special characteristics of B, C and D

Behaviour of B and C: The signal is directly activated when reaching the set pivot point (P).

Behaviour D: The signal is activated shortly before reaching the set pivot point (P). The switch-on point is determined by pulse duration (±/– range around the pivot point). Pulse duration depends on parameter Outer dead band M0148 and amounts to 1.0 % of the travel for default setting.

Information

For behaviours B and C, the signal might be omitted if, e.g. when using a positioner, pivot point (P) is not fully reached due to the dead band. In this case, behaviour D can be selected as the dead band is considered.

8.1.3. Hysteresis for intermediate positions: set

The hysteresis determines the tripping point of the signal.

Example

Parameter Pivot point 6 M0253 is set to 50.0 % of the travel.

Parameter Hysteresis 6 M0282 is set to 1.0 %.

Figure 37: Signal behaviour B, C, D for hysteresis = 1 %

P1 Switching on point (∗)
P2 Switch-off point (○)
pT Pulse duration = 2 times XT + hysteresis

Required user level: AUMA (6).

M > Customer settings M041
    Intermediate positions M0143
Hysteresis M0267
Hysteresis 1 M0277

Default values: 0.5 % for all 8 positions
Setting range: 0.0 % to 5.0 % of the travel (from OPEN to CLOSED)

Information
For signal behaviour D, the value XT (Outer dead band M0148 parameter) determines pulse duration pT and influences switch-on point P1.

8.2. Operation profile (operation behaviour) for intermediate positions

<table>
<thead>
<tr>
<th>Condition</th>
</tr>
</thead>
</table>
Function <Positioner>, parameter Positioner M0158 = Function active (Required user level: Specialist (4) or higher)

Characteristics
The function <Operation profile> can be used to define the operation behaviour of the actuator when reaching an end position. Example: The actuator stops and only continues its operation after another operation command. This function is required in special applications to avoid water hammer, possibly also in combination with the timer.

8.2.1. Operation profile: activate

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
</table>
Function not active
Function active

8.2.2. Operation behaviour for intermediate positions (pivot points): set

When reaching an intermediate position, the operation behaviour of the actuator may be set.

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
</table>
Off
Stop in OPEN
• Actuator stops at pivot point during operation in direction OPEN.
• Another operation command must be issued to resume operation.
• This function is not active in the operation mode Remote SETPOINT.
Stop in CLOSED
• Actuator stops at pivot point during operation in direction CLOSE.
• Another operation command must be issued to resume operation.
• This function is not active in the operation mode Remote SETPOINT.
Stop in OPEN & CL.
• Actuator stops automatically upon reaching the pivot point.
• Another operation command must be issued to resume operation.
• This function is not active in the operation mode Remote SETPOINT.
Off time in OPEN
Actuator stops at pivot point during operation in direction OPEN. If an operation command in direction OPEN is present at the end of the pause time, the actuator
resumes operation into direction OPEN. If an operation command in direction CLOSE is present during the pause time, the pause is interrupted and operation into direction CLOSE resumed.

**Off time in CLOSED**

When reaching the pivot point, the actuator stops during operation in direction CLOSE. If an operation command in direction CLOSE is present at the end of the pause time, the actuator resumes operation into direction CLOSE. If an operation command in direction OPEN is present during the pause time, the pause is interrupted and operation into direction OPEN resumed.

**Off time in OPEN & CL**

Actuator stops automatically upon reaching the pivot point. If an operation command in direction OPEN or CLOSE is present at the end of the pause time, the actuator resumes operation depending on the operation command.

**Information**

The actuator stops for each activated intermediate position, for which operation behaviour Stop in OPEN, Stop in CLOSED or Stop in OPEN & CL is assigned.

### 8.2.3. Off times for intermediate positions (pivot points): set

An off time can be defined for each pivot point. Once a pivot point with the operation behaviour Off time in OPEN, Off time in CLOSED or Off time in OPEN & CL is reached, the AC generates the Operation pause active indication during the off time.

Required user level: Specialist (4) or higher.

**M ☞ Customer settings M041**  
**Intermediate positions M0143**  
**Off times M0268**  
**Off time 1 M0285**

Default values: 1s  
Setting ranges: 1 to 1,800 seconds

### 8.3. Two-wire control

**— Option —**

**Conditions**

Operation mode Remote (Selector switch = position Remote control).

**Characteristics**

With the function <Two-wire control>, the actuator can be operated to end position OPEN or CLOSED via a digital input.

**Information**

In this function, the actuator only reacts to commands via the input OPEN / CLOSE. Other inputs to which the operation commands OPEN, STOP, CLOSE were assigned, do not have any function.

**Execute operation commands via digital input:**

Designation of digital input OPEN / CLOSE  
(wiring diagram designation: OPEN/CLOSE)

**Default setting**

- Input OPEN / CLOSE = low level (0 V DC or input open):  
  Actuator runs in direction CLOSE.
- Input OPEN / CLOSE = high level (standard: +24 V DC):  
  Actuator runs in direction OPEN.

**Configuration of digital input**

For the two-wire control, a digital input for the OPEN / CLOSE signal has to be configured.

Required user level: Specialist (4)

**M ☞ Device configuration M0053**  
**I/O interface M0139**  
**Digital inputs M0116**
Example
Use input DIN 5 for signal OPEN / CLOSE:
Parameter: Signal DIN 5 M0122 = OPEN/CLOSE

Information
The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 6 M0128), the input is either High active or Low active. Default setting is High active.

<table>
<thead>
<tr>
<th>8.4. Positioner (operation mode Remote SETPOINT)</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Option</em> —</td>
</tr>
</tbody>
</table>

Conditions
This function requires one of the following equipments within the actuator:
- Electronic control unit with MWG (Non-Intrusive version)
- Potentiometer
- Electronic position transmitter EWG/RWG

Further conditions for the positioner operation mode:
- Positioner enabled and activated.
- Operation mode Remote (selector switch = position Remote control).

Characteristics
The positioner records setpoint position E1 and actual position value E2 for comparison. Depending on the detected deviation, the actuator motor then runs in direction OPEN or CLOSE.

Information
- If the actuator is controlled via a setpoint (e.g. 0 – 20 mA), the status indication S0003 on the display shows both the setpoint position E1 and the actual position value E2.
- If the status indication S0003 only shows the actual position value E2, OPEN - CLOSE control is active: there is no setpoint control via the positioner. In this case, you have to change-over to setpoint control first, refer to <Change-over between OPEN - CLOSE control and setpoint control> chapter.

<table>
<thead>

M Device configuration M0053
Application functions M0178
Activation M0212
Positioner M0158

Default value: Function not active

Setting values:
- Function not active: Function <Positioner> deactivated.
- Function active: Function <Positioner> activated.

<table>
<thead>
<tr>
<th>8.4.2. Adaptive behaviour: switch on or off</th>
</tr>
</thead>
</table>

Adaptive positioning may reduce the number of starts and compensate for the overrun of the actuator.

M Customer settings M0041
Positioner M0145
Adaptive behaviour M0147

Default value: Adaptive I

Setting values:
- Off: Adaptive behaviour switched off.
- Adaptive I: Adaptive behaviour for precise positioning (high positioning accuracy).

Due to the inertia of actuator and valve, the valve position changes only slightly after switching off the actuator (overrun). The positioner determines the resulting error.
between setpoint and actual value for both directions and automatically adapts the inner dead bands $X_i$ and therefore switching point $P_2$.

On the basis of the determined inner dead bands $X_i$ and the set hysteresis (parameters Positioner hyst. OPEN M0598 or Positioner hyst. CLOSE M0599), the outer dead bands $X_T$ are automatically determined.

This reduces the error caused by the overrun after only a few operations and a high positioning accuracy is achieved.

Figure 38: Positioner positioning behaviour

8.4.3. Overrun (inner dead band): set manually

The inner dead band determines the switch-off point of the actuator and therefore influences the overrun.

The inner dead band may be set individually for the directions OPEN and CLOSE. Manual setting is only possible if the adaptive behaviour, parameter Adaptive behaviour M0147 is switched off.

<table>
<thead>
<tr>
<th>Customer settings</th>
<th>M0041</th>
</tr>
</thead>
<tbody>
<tr>
<td>Positioner</td>
<td>M0145</td>
</tr>
<tr>
<td>Dead band OPEN</td>
<td>M0234</td>
</tr>
<tr>
<td>Dead band CLOSE</td>
<td>M0235</td>
</tr>
</tbody>
</table>

Default values: 0.5 % for dead band OPEN and CLOSED

Setting ranges: 0.0 – 10.0 % for dead band OPEN and CLOSED

Information

- Inner dead bands may not be set wider than outer dead bands.
- Inner dead bands may not be set too narrow as this may cause unnecessary switching procedures (premature wear) or oscillation of the actuator.

8.4.4. Max. error variable (outer dead band): set manually

The outer dead band determines the switching-on point of the actuator.
The motor starts if the actual value (input signal E2) or a change in nominal value is higher than the max. error variable determined by the outer dead band.

Manual setting is only possible if the adaptive behaviour, parameter Adaptive behaviour M0147 switched off.

**8.4.5. Dead time: set**

The dead time prevents the operation to a new setpoint position within a pre-determined time.

**8.4.6. Hysteresis for positioner: set**

The hysteresis determines the switching accuracy. It can be used to reduce the number of starts for example.

This setting can only be made if the adaptive behaviour, parameter Adaptive behaviour M0147 is set to Adaptive I.

**8.4.7. Closing fully/opening fully (end position tolerance for setpoint)**

If the end positions cannot be reached due to inaccurate analogue setpoint signals (0/4 mA or 20 mA), a tolerance for the setpoint within the end position range can be set. If the tolerance is exceeded or not reached, the actuator continues the operation until the full end position has been reached. This ensures that the actuator opens and closes fully.
### 8.4.8. Setting range: limit

Travel can be limited in directions OPEN and/or CLOSE.

This prevents end position(s) OPEN and/or CLOSED from being approached in modulating duty. The actuator stops when reaching the set limit value.

For OPEN - CLOSE control (LOCAL or REMOTE OPEN-CLOSE operation mode), this limitation is not active. The valve can then be run into the end positions either via the local controls or from remote.

Figure 39: Limitation of setting range

</tbody>
</table>

Default values:
- Limit OPEN = 100.0%
- Limit CLOSE = 0.0%

#### Setting ranges: 0.0 ... 100.0 % of travel

### 8.4.9. Change-over between OPEN - CLOSE control and setpoint control

For actuators equipped with a positioner, it is possible to change over between OPEN - CLOSE control (Remote OPEN-CLOSE) and setpoint control (Remote SETPOINT).

**Condition**

For the change-over, a digital input for the signal MODE has to be available and configured.

**Configuration of digital input**

Required user level: **Specialist (4)**.

<table>
<thead>
<tr>
<th>M &gt;</th>
<th>Device configuration M0053</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>I/O interface M0139</td>
</tr>
<tr>
<td></td>
<td>Digital inputs M0116</td>
</tr>
</tbody>
</table>
Example

Use input DIN 1 for change-over:

Parameter: Signal DIN 1 M0118

Setting value: MODE (wiring diagram designation: MODE)

Information

The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 4 M0126), the input is either High active or Low active. Default setting of MODE input is Low active.

Change-over via digital input MODE

Switching behaviour for coding Low active:

(Default factory setting)

- Input MODE = low level (0 V DC or input open) = Remote SETPOINT
  The actuator reacts to a setpoint signal (e.g. 0/4 – 20 mA)

- Input MODE = high level (standard: +24 V DC) = Remote OPEN-CLOSE:
  The actuator reacts to operation commands OPEN, STOP, CLOSE.

8.4.10. Input of setpoint position

The setpoint position is generally led via input AIN1, but can also be led via AIN 2.

Required user level: AUMA (6).

M >

Device configuration M0053
I/O interface M0139
Analogue inputs M0389
  Signal AIN 1 M0135
  Signal AIN 2 M0138

Default value AIN 1: Setpoint position

8.4.11. Input range of setpoint position

Required user level: Specialist (4) or higher.

M >

Device configuration M0053
I/O interface M0139
Analogue inputs M0389
  Low limit AIN 1 M0133
  High limit AIN 1 M0134

Default values:

Low limit AIN 1 = 0 mA
High limit AIN 1 = 20 mA
Setting values: 0 ... 20 mA

8.4.12. Split Range operation

Requirements

<Positioner> function must be enabled and activated:

In Split Range operation, a setpoint position E1 can be shared by up to three positioners. A typical application example is a pipeline with a bypass. The actuator mounted on the bypass reacts in the lower limit (e.g. 0 – 10 mA), the actuator on the main valve in the upper limit (e.g. 10 – 20 mA). If the setpoint position is within the setpoint range defined for the individual actuator, the actuator behaviour will be identical to standard positioner operation. If the setpoint position is higher or lower than the upper or the lower limit of the setpoint range of the respective actuator, the actuator will run to positions OPEN or CLOSED.

The upper and lower limit of the respective actuator is defined via the analogue input. (<Input range of setpoint position>)

In addition, the upper and lower limit of the total target value (valid for all actuators grouped in a split range operation).
Activate split range operation

Required user level: Specialist (4) or higher.

- **Device configuration** M0053
- **Application functions** M0178
- **Activation** M0212
- **Split range operation** M01650

**Default value:** Function not active

**Setting values:**

- Function not active
  - <Split range operation> function deactivated.

- Function active
  - <Split range operation> function activated.

Set total target value range

The set lower limit of total target value is used as failure source for failure behaviour during split range operation. <Failure behaviour on loss of signal>

- **Customer settings** M0041
  - **Positioner** M0145
  - **Low limit target value** M01651
  - **High limit target value** M01652

**Default values:**

- **Low limit target value** = 0.0 mA
- **High limit target value** = 20.0 mA

**Setting ranges:** 0.0 ... 20.0 mA

8.5. Process controller

--- Option ---

**Requirements**

This function requires one of the following equipments within the actuator:

- Electronic control unit with MWG (non-intrusive version)
- Potentiometer
- Electronic position transmitter EWG/RWG

Further conditions for the process controller operation mode:

- Process controller enabled and activated.
- Operation mode Remote (Selector switch = position Remote control).

**Characteristics**

The following figure illustrates the function of the process controller:

The process controller [2] receives the process setpoint E7 and the actual process value E4 (e.g. from a sensor). On the basis of both values, the process controller calculates the position setpoint E1 for positioner [3]. In turn, the positioner [3] compares this target setpoint with the actual position value E2 of the valve and issues the operation commands (OPEN - CLOSE) for the actuator.
Figure 40: Process controller function

**Application**

The process controller can be used to control pressure, flow or flow rates, flow levels and temperature.

### 8.5.1. Process controller activation

Required user level: **Specialist (4)** or higher.

- **Device configuration** M0053
- **Application functions** M0178
- **Activation** M0212
- **Process controller** M0741

**Default value:** Function not active

**Setting values:**

- Function not active: <Process controller> function deactivated.
- Function active: <Process controller> function activated.

### 8.5.2. Process controller: set modulating behaviour

Three controller types are available to ideally adapt the modulating behaviour of the process controller to the respective application.
M > Customer settings M0041
  Process controller M0742
  Modulating behaviour M0887

Default value: PI controller

Setting values:

P controller

P controller immediately reacts to a control deviation (i.e. actively) and amplifies the input signal (error variable) proportionally to the set amplification. Setting parameter: Proport. gain Kp M0744

Figure 41: Step response of P controller

P controller application

For uncritical closed-loop applications allowing to accept continuous error variables in the event of failures, e.g. pressure, flow, filling level and temperature control.

PI controller

PI controllers consist of a P fraction immediately reacting to a control deviation and an I fraction for chronological integration of the input signal (error variable). Due to the additional time constant of the I fraction, the output value takes more time to reach the target status (i.e. inertia of control loop response) whereas positioning accuracy increases at the same time (lower control deviation). Parameters for setting the time constant: Reset time TI M0745

Figure 42: Step response of PI controller

PI controller application

Quick control circuits not allowing continuous error variables, e.g. pressure, temperature and ratio control.

PID controller

Compared to the PI controller, the PID controller has an additional D fraction accounting for changes in the error variable (change rate). The D fraction quickly reacts to changes, even to minor control deviations with large output values. Parameter for setting the D fraction: Rate time Td M0746

Figure 43: Step response of PID controller

PID controller use

For precise and highly dynamic control not allowing a continuous error variable.

8.5.3. Setpoint source (input for process setpoint)
Setpoint source M0743

Default value: I/O interface

Setting values:

- **I/O interface**: The process setpoint is defined via an analogue input (AIN 1 or AIN 2) of the I/O interface.
- **Internal setpoint**: The process setpoint is generated internally via actuator controls: parameters Internal setpoint 1 M0749 / Internal setpoint 2 M0750

Information: To use internal setpoint 2, a digital input must be configured accordingly.

### 8.5.4. Behaviour on loss of process setpoint

- **Customer settings M0041**
- **Process controller M0742**
- **Beh. setpoint failure M0747**

Default value: Internal setpoint 1

Setting values:

- **Internal setpoint 1**: In case of process setpoint signal loss, the actuator controls switch to the internal setpoint 1. Parameter Internal setpoint 1 M0749
- **Internal setpoint 2**: In case of process setpoint signal loss, the actuator controls switch to the internal setpoint 2. Parameter Internal setpoint 2 M0750
- **Failure behaviour**: In case of process setpoint signal loss, failure behaviour procedure is activated. Parameter Failure behaviour M0378
- **Last setpoint**: In case of process setpoint signal loss, the last available process setpoint will still be used as setpoint.

### 8.5.5. Inverse operation

As standard, the valve is opened by the modulating actuator as soon as the actual process value falls below the process setpoint. Depending on the process, it may, however, be necessary that the valve closes as soon as the actual process value falls below the process setpoint. In this case, the respective parameters are used to set the process controller to inverse operation.

- **Customer settings M0041**
- **Process controller M0742**
- **Inverse operation M0748**

Default value: Function not active

Setting values:

- **Function not active**: Inverse operation is deactivated.
- **Function active**: Inverse operation is activated.

### 8.5.6. Internal process setpoint

An internal process setpoint may be set with this parameter. The internal process setpoint is used if:

- Parameter Setpoint source M0743 is set to Internal setpoint or
- Parameter Beh. setpoint failure M0747 is set to Internal setpoint 1 or Internal setpoint 2.

- **Customer settings M0041**
- **Process controller M0742**
- **Internal setpoint 1 M0749**
- **Internal setpoint 2 M0750**

Default value: 50.0 %

Setting range: 0.0 ... 100.0 %
8.5.7. Setting procedure

The setting of the process controller largely depends on the area of controller application. A PI controller suffices for most applications.

Procedure

1. Operate the controller as PT controller, i.e. set the parameters as follows:
   - Proportional gain $K_p = 1$
   - Reset time $T_i = 1,000$ s
   - Rate time $T_d = 0$
2. Double proportional gain $K_p$ until the control loop starts to oscillate.
3. Reduce proportional gain $K_p$ to 60 % of the set value.
4. Decrease reset time $T_i$ until the error variable equals zero.

8.5.8. Proportional amplification $K_p$: set

In the event of an error variable, the P portion immediately (i.e. actively) changes the position value proportionally to the error variable.

If a small error variable already requires a major valve position adjustment, the proportional gain $K_p$ must be increased.

Information

- If the reaction is too extreme (overshoot), the value must be reduced. If the reaction is too weak, the value must be increased.

M ▶ Customer settings M0041
   Process controller M0742
   Proport. gain $K_p$ M0744

Default value: 1.0
Setting range: 0.1 ... 10.0

8.5.9. Reset time $T_i$: set

The reset time determines the I portion of the controller. The more inert a system, the higher this value should be set.

Information

- Increase $T_i$ in case of propensity for oscillation.
- Decrease $T_i$ if the reactions are excessively delayed.
- Starting value for fast processes (e.g. pressure): 10 s
- Starting value for slow processes (e.g. temperature): 1000 s

M ▶ Customer settings M0041
   Process controller M0742
   Reset time $T_i$ M0745

Default value: 1,000 s (seconds)
Setting range: 1 ... 1000 s

8.5.10. Rate time $T_d$: set

The rate time determines the D portion of the controller. Typically, no setting is required here ($= 0$), since actuator and valve – due to the operating time – cannot react abruptly to a sudden occurrence of an error variable.

Information

- Increase $T_d$ in case of propensity for oscillation.
- Initial value for actuators: 0 s

M ▶ Customer settings M0041
   Process controller M0742
   Rate time $T_d$ M0746

Default value: 0 s (seconds)
Setting range: 1 ... 100 s
8.5.11. Actual value source (input for actual process value)

M > Customer settings M0041
Process controller M0742
Actual value source M0756

Default value: I/O interface

Setting values:
I/O interface The actual process value is defined via an analogue input (AIN 1 or AIN 2) of the I/O Interface.

8.6. Stepping mode

— Option —

Conditions
This function requires one of the following equipments within the actuator:
- MWG (Non-Intrusive version)
- Potentiometer
- Electronic position transmitter EWG/RWG

Characteristics
- With stepping mode, the operating time can be increased for the entire or any portion of the valve travel.
- Stepping mode can be individually activated for the directions OPEN and CLOSE.

Figure 44: Stepping mode

- [1] Stepping range OPEN
- [2] Stepping range CLOSE
- P1 Start of stepping mode
- P2 End of stepping mode
- t1 Operating time for normal operation
- t2 Operating time for stepping mode
- t3 Running time
- t4 Off time

8.6.1. Stepping mode: activate

Stepping mode can be individually activated for the directions OPEN and CLOSE.

Required user level: Specialist (4) or higher.
8.6.2. Operation mode for stepping mode

Stepping mode can be activated via operation modes Local and/or Remote.

8.6.3. Start and end of stepping mode

Start and end of stepping mode can be individually set for both directions.

8.6.4. On times and off times

On or off times can be set individually for directions OPEN and CLOSE.
8.7. **By-pass function**

— Option —

**Application**  
The by-pass function is used, e.g. for district heating pipelines. Under high pipeline pressure, the gate valve of the main valve cannot be used, pressure compensation via by-pass valve is therefore required.

**Function**  
Two MOVs – one main valve and a by-pass valve – are linked via enable signals **Bypass Sync In** and **By-pass Sync Out**. Operation commands can only be executed if one of the two actuators sends the enable signal to the other. Release depends on the end position. This ensures that only the following operation commands may be executed:

- The main valve can only be operated in directions OPEN or CLOSE if the by-pass valve is in end position OPEN.
- The by-pass valve can only be operated in direction CLOSE if the main valve is in end position CLOSED. However, it can always be operated in direction OPEN.

Figure 45: Function

Table 7: Main valve reaction to by-pass valve position.

<table>
<thead>
<tr>
<th>By-pass valve Position</th>
<th>Sends enable signal <strong>Bypass Sync OUT</strong></th>
<th>Main valve Release (available operation commands)</th>
</tr>
</thead>
<tbody>
<tr>
<td>End position OPEN</td>
<td>High level (Default: +24 V DC)</td>
<td>in directions OPEN and CLOSE</td>
</tr>
<tr>
<td>other position than end position OPEN</td>
<td>Low level (0 V DC or input open-circuit):</td>
<td>No operation possible¹</td>
</tr>
</tbody>
</table>

¹) In case of an operation command, the "Interlock by-pass" signal is sent (no release).
Table 8: By-pass valve reactions to main valve position

<table>
<thead>
<tr>
<th>Main valve</th>
<th>By-pass valve</th>
</tr>
</thead>
<tbody>
<tr>
<td>Position</td>
<td>Sends enable signal Bypass Sync OUT</td>
</tr>
<tr>
<td>End position CLOSED</td>
<td>High level (Standard: +24 V DC)</td>
</tr>
<tr>
<td>Other position than end position CLOSED</td>
<td>Low level (0 V DC or input open-circuit)</td>
</tr>
</tbody>
</table>

1) In case of an operation command in direction CLOSE, the "Interlock by-pass" signal is sent (no release).

**EMERGENCY behaviour**

The emergency behaviour of the by-pass function has the same characteristics as the <EMERGENCY behaviour> function with the following differences:

In an EMERGENCY situation, both controls receive the EMERGENCY signal at the same time. This signal starts the EMERGENCY operation specially defined for the by-pass function. (Parameter **EMCY operation M0204** is therefore not available in the <EMERGENCY behaviour> function).

**EMERGENCY operation procedure**

1. By-pass valve is opened first.
2. Once the by-pass valve is fully opened, the main valve is closed.
3. Once the main valve is fully closed, the by-pass valve is fully opened.

**Configuration of digital inputs**

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>M ▶ Device configuration M0053</th>
</tr>
</thead>
<tbody>
<tr>
<td>I/O interface M0139</td>
</tr>
<tr>
<td>Digital inputs M0116</td>
</tr>
</tbody>
</table>

**Example**

Use input DIN4 for signal **Bypass Sync In**:

Use input DIN6 for signal **EMERGENCY**:

**Setting values:**

- **Signal DIN 5 M0122 = By-pass Sync In**
  (wiring diagram designation: **BYPASS SYNC IN**)
- **Signal DIN 6 M0121 = EMERGENCY**
  (wiring diagram designation: **NOT/EMERGENCY**)

**Information**

The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. **Coding DIN 6 M0128**), the input is either **High active** or **Low active**. Default setting is **High active**.

**Configuration of digital output**

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>M ▶ Device configuration M0053</th>
</tr>
</thead>
<tbody>
<tr>
<td>I/O interface M0139</td>
</tr>
<tr>
<td>Digital outputs M0110</td>
</tr>
</tbody>
</table>

**Example**

Use output DOUT6 for signal **Bypass Sync Out**:

**Parameter:** **Signal DOUT 6 M0111**

**Setting value:** **Bypass Sync Out** (wiring diagram designation: **BYPASS SYNC OUT**)

8.7.1. **Bypass function: activate**

Required user level: Specialist (4) or higher.
8.7.2. By-pass application: configure

The actuators for the two MOVs (valves) have to be configured according to their application (main or by-pass valve).

**Setting values:**

- **Function not active** Bypass function deactivated.
- **Function active** Bypass function activated.

8.8. Lift Plug Valve (LPV)

--- Option ---

**Application**

A "Lift Plug Valve" is a special valve whose closing element must first be lifted out of its seat or locking position before being rotated for opening or closing the valve. Locking of the valve and/or pressure relief prior to rotation of the closing element can thus be implemented. Once the end position has been reached, the closing element has to be lowered again. Such valves are in particular used for significant pressure differences (pressure relief) and safety-related systems (locking).

**Requirements**

- Two actuator controls and actuators are required, one of them is considered as master actuator (MA), the other one as slave actuator (SA).
- The actuator controls of the master actuator require an additional <Parallel interface> I/O Interface 2.

**Function**

Due to the special design of the LPV valves, they can only be operated in OPEN-CLOSE duty (no modulating duty). For this type of duty, two actuators are required which are operated as a master-slave-system with master actuator (rotary movement) and slave actuator (stroke movement). However, only one actuator or actuator controls is "visible" at the DCS, i.e. the slave actuator is completely controlled and monitored by the master actuator. Communication between master and slave actuator is performed via the additional <Parallel interface> I/O Interface 2.
The master actuator may generally only be operated in direction OPEN or CLOSE if the slave actuator is fully opened. This is ensured by a signal of the slave actuator to the digital LPV SyncIn input of the master actuator as soon as the slave actuator has reached end position OPEN. The slave actuator may generally only be operated in direction CLOSE if the master actuator is in end position OPEN or CLOSED. This is ensured by a corresponding signal of the master actuator to the digital LPV SyncIn input of the slave actuator. However, it can always be operated in direction OPEN.

If the master actuator receives an operation command for direction OPEN or CLOSE, it will first send a command to the slave actuator for operation in direction OPEN. Once the slave actuator has reached end position OPEN and sends the feedback signal, the master actuator executes the requested operation command itself. After reaching the desired end position, it will request the slave actuator to run to end position CLOSED.

Example of digital input configuration

Required user level: Specialist (4)

Device configuration M0053
I/O interface M0139
Digital inputs M0116

Master actuator (MA) Use input DIN 7 for signal LPV system ok.
Use input DIN 8 for signal LPV end position CL,
Use input DIN 9 for signal LPV Sync In,
Use input DIN 10 for signal LPV sel.sw.Remote:

**Setting values:**

<table>
<thead>
<tr>
<th>Signal DIN 7 M0383</th>
<th>LPV system ok (SA)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal DIN 8 M0390</td>
<td>LPV end position CLOSED (SA)</td>
</tr>
<tr>
<td>Signal DIN 9 M0391</td>
<td>LPV Sync In</td>
</tr>
<tr>
<td>Signal DIN 10 M0392</td>
<td>LPV sel. sw. REM (SA)</td>
</tr>
</tbody>
</table>

**Slave actuator (SA)**

Use input DIN 1 for signal LPV Sync In,
Use input DIN 2 for signal (Run) CLOSE,
Use input DIN 3 for signal (Run) OPEN:

**Setting values:**

<table>
<thead>
<tr>
<th>Signal DIN 1 M0117</th>
<th>LPV Sync In</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal DIN 2 M0120</td>
<td>CLOSE</td>
</tr>
<tr>
<td>Signal DIN 3 M0119</td>
<td>OPEN</td>
</tr>
</tbody>
</table>

**Information**

The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 7 M0393), the input is either High active or Low active. Default setting is High active.

---

**Example of digital output configuration**

**Required user level:** Specialist (4)

**Device configuration** M0053

**I/O interface** M0139

**Digital outputs** M0110

**Master actuator (MA)**

Only the outputs used for control of the slave actuator are listed, the outputs to the DCS are preset as standard (e.g. End position CLOSED, End position OPEN, Selector sw. REMOTE, Failure (Cfg))

Use output DOUT 8 for signal LPV SA-CLOSE,
Use output DOUT 9 for signal LPV SA-OPEN,
Use output DOUT 10 for signal LPV Sync Out:

**Setting values:**

<table>
<thead>
<tr>
<th>Signal DOUT 8 M0398</th>
<th>LPV run CLOSE (SA)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal DOUT 9 M0399</td>
<td>LPV run OPEN (SA)</td>
</tr>
<tr>
<td>Signal DOUT 10 M0400</td>
<td>LPV Sync Out</td>
</tr>
</tbody>
</table>

**Slave actuator (SA)**

Use output DOUT 1 for signal System ok,
Use output DOUT 2 for signal End position CLOSED,
Use output DOUT 3 for signal LPV Sync Out,
Use output DOUT 4 for signal Selector sw. REMOTE:

**Setting values:**

<table>
<thead>
<tr>
<th>Signal DOUT 1 M0109</th>
<th>System ok</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal DOUT 2 M0115</td>
<td>End position CLOSED</td>
</tr>
<tr>
<td>Signal DOUT 3 M0114</td>
<td>LPV Sync Out</td>
</tr>
<tr>
<td>Signal DOUT 4 M0113</td>
<td>Selector sw. REMOTE</td>
</tr>
</tbody>
</table>

**Information**

The logic for the digital outputs may be inverted. Depending on the parameter setting (e.g. Coding DOUT 1 M0102), the input is either High active or Low active. Default setting is High active.
8.8.1. LPV function: activate

Required user level: Specialist (4) or higher.

- **Device configuration** M0053
- **Application functions** M0178
- **Activation** M0212
- **LPV function** M1087

**Default value:** Function not active

**Setting values:**
- Function not active: Function deactivated.
- Function active: Function activated.

8.8.2. LPV actuator type: configure

Required user level: Specialist (4) or higher.

When using the LPV function, it must be defined for each actuator controls whether it controls the master or the slave actuator.

- **Customer settings** M0041
- **Lift Plug Valve** M1089
- **LPV application** M1090

**Default value:** MA master actu./rotat.

**Setting values:**
- MA master actu./rotat: Actuator controls/actuator act as master actuator is in charge of the rotation of the closing element.
- SA slave act./stroke: Actuator controls/actuator act as slave actuator is in charge of the stroke of the closing element.

8.8.3. Delay time of master LPV actuator: configure

**Configure delay time for operation in direction OPEN**

A delay time for operation in direction OPEN can be defined in end position CLOSED of the master actuator. When reaching end position OPEN of the slave actuator, the procedure for opening valve will be delayed by this time. The master actuator will then run in direction OPEN.

Required user level: Specialist (4) or higher.

- **Customer settings** M0041
- **Lift Plug Valve** M1089
- **Delay MA direct.OPEN** M1091

**Default value:** 02:00.0

**Setting ranges:** 00:00.0 ... 15:00.0 minutes (minutes:seconds)

**Configure delay time for operation in direction CLOSE**

A delay time for operation in direction CLOSE can be defined in end position OPEN of the master actuator. When reaching end position OPEN of the slave actuator, the procedure for closing valve will be delayed by this time. The master actuator will then run in direction CLOSE.

Required user level: Specialist (4) or higher.

- **Customer settings** M0041
- **Lift Plug Valve** M1089
- **Delay MA direct.CLOSE** M1092

**Default value:** 00:00.0

**Setting ranges:** 00:00.0 15:00.0 minutes (minutes:seconds)
8.8.4. Delay time of slave LPV actuator: configure

A delay time for operation in direction CLOSE of the slave actuator can be defined in end positions OPEN and CLOSED of the master actuator. When reaching end positions OPEN or CLOSED of the master actuator, the procedure for opening or closing valve will be delayed by this time. The slave actuator will then run in direction CLOSE.

Required user level: Specialist (4) or higher.

**Customer settings M0041**
- Lift Plug Valve M1089
- Delay SA direct.CLOSE M1093

Default value: 00:00.0

Setting ranges: 00:00.0 ... 15:00.0 min:s (minutes:seconds)

8.9. Multiport valve function (operation to position)

— Option —

**Application**

For valves not equipped with end stops (multi-turn) and with up to 12 ports (multiport valves)

**Characteristics**

The multiport valve function allows to directly access a valve port (position) of a valve equipped with up to 12 ports without stopping at any other port (position). Example: Operation from position 2 to 4 without stopping at position 3.

In the operation mode Local, the set position are approached as directly as possible, i.e. the direction of rotation (clockwise or counterclockwise) depends on the current position of the valve.

In operation mode Remote, up to 10 positions can either be approached with a defined direction of rotation (counterclockwise or clockwise) or as directly as possible. The actuator then operates the valve with the defined direction of rotation or as directly as possible to the defined valve attachment, irrespective of the actuator position.

**Information**

- The multiport valve function is only permissible in combination with an AUMA actuator and an AUMA gearbox.
- The output speed at the output drive (of the gearbox) or the valve should not exceed approx. 0.3 rpm; otherwise positioning accuracy will decrease.

**Procedure for commissioning a multiport valve**

1. Set/check multiport valve parameters:
   (generally, they are set in the factory prior to delivery)
   - Actuator type
   - Gear reduction ratio
   - Number of ports (positions)
   - Configuration of digital inputs
2. Define/check positions (of valve ports).
3. Set/check signal behaviour of positions.
4. Set home port (zero position).
5. Approach positions.
6. If required, perform/correct multiport valve parameter settings like inertia, dead band, backlash compensation and hysteresis.

8.9.1. Multiport valve function: activate

Required user level: Specialist (4) or higher.

**Device configuration M0053**

**Application functions M0178**
### 8.9.2. Actuator type: set/check

The actuator type is set in the factory but can be modified at a later date.

Required user level: Specialist (4) or higher.

#### M >
- **Customer settings** M0041
  - **Multiport valve** M1140
  - **Actuator type** M1142

#### Default value: Actuator type set in the factory

#### Setting ranges: Selection list of all AUMA actuators

### 8.9.3. Gear reduction ratio: set/check

The reduction ratio of the gear stage of the actuator mounted to the valve gearbox must be set here. To facilitate adjustment, a selection table of supported gearboxes is available.

Required user level: Specialist (4) or higher.

#### M >
- **Customer settings** M0041
  - **Multiport valve** M1140
  - **Reduction ratio** M1143

#### Default values: GS50.3

#### Setting values:

Table 9: Selection of gearboxes supported by AUMA

<table>
<thead>
<tr>
<th>Sizes GS 50.3 – GS 125.3</th>
<th>Sizes GS160.3 – GS 250.3</th>

</tbody>
</table>

### 8.9.4. Number of ports (positions)

Number of valve ports (positions)

Required user level: Specialist (4) or higher.

#### M >
- **Customer settings** M0041
  - **Multiport valve** M1140
  - **Number of ports** M1141

#### Default value: 8

#### Setting range: 0 to 12
8.9.5. Home port (zero position): set

The home port is the zero position (0° or 360° of one turn) and is consequently the starting point for all other intermediate positions.

**Information**
Set the gear reduction ratio (parameter *Reduction ratio M1143*) and the actuator type (parameter *Actuator type M1142*) prior to setting the home port.

**Set home port**
1. Position multiport valve to zero position either via manual operation (handwheel) or via motor operation (via push buttons of local controls).
2. In a next step, confirm this position (with *Yes*) as home port via parameter *MPV home port M1162*.
   - As an alternative, the home port position can also be confirmed via a signal at a digital input. To this end, a digital input has to be available and configured.

**Set home port (zero position) via parameter**

Required user level: Specialist (4) or higher.

**Example**

Use input DIN 5 for “Set home port” signal:

- **Parameter**: Signal DIN 5 M0122
- **Setting value**: MPV set home pos. (wiring diagram designation: Home port)

**Information**
The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. *Coding DIN 5 M0127*), the input is either **High active** or **Low active**. Default setting is **High active**.

8.9.6. Positions (of valve ports): define/check

Each position can be set to any value between 0° and 360° (one full turn of the valve).

**Information**
Prior to setting the positions, the home port must be defined (*MPV home port parameter*).

This corresponds to the zero position of the valve (0° or 360° of one full valve turn as well as 0 % or 100 % of position feedback).

The positions of the valve ports have to be set afterwards.

**Example configuration for a multiport valve comprising 8 ports**: All 8 positions are evenly spread across 360°.

- **Position 1** = 0.0 (or 360°)
- **Position 2** = 45.0
8.9.7. Operate to position via push buttons of the local controls

To operate to a position via push buttons of the local controls, status indication S0017 must be shown (refer to <Indications in the display>).

Figure 48: Status indication of multiport valve (selector switch in position OFF)

Operation in clockwise or counterclockwise direction:

When changing the selector switch to position Local control (LOCAL), the display changes:

Figure 49: Status indication of multiport valve (selector switch in position LOCAL)

As a consequence, the valve can be operated into clockwise or counterclockwise direction (display shows CW or CCW)

Direct operation to a position:

When selector switch is in position 0 (OFF), the function “Direct operation to a position via push buttons” is activated via Details (push button ▼) (display shows Esc).

Figure 50: Status indication of multiport valve (selector switch in position OFF)

When changing the selector switch to position Local control (LOCAL), the display changes for selection of the desired position:

Figure 51: Status indication of multiport valve (selector switch in position LOCAL)

Select the desired position (P1, P2, ...) via push buttons ▲▼ and confirm selection via Ok (push button ▼▲).

→ The operation is issued as soon as push button Ok is pressed.
Symbol

<table>
<thead>
<tr>
<th>Symbol</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>▼</td>
<td>Set positions (of valve ports)</td>
</tr>
<tr>

</tr>
<tr>
<td>– – / –N/A–</td>
<td>No position has been selected.</td>
</tr>
<tr>
<td>E2</td>
<td>Actual position value</td>
</tr>
</tbody>
</table>

To interrupt an operation (triggered operation command):

→ Select "– – / –N/A–" during operation, and confirm via Ok (push button ←). The actuator stops in its current position.

### 8.9.8. Operate to position from Remote

For direct operation to position from remote, make sure that selector switch position **Remote control** (REMOTE) is selected.

#### Operation to position via digital inputs

An input (DIN) must be configured for each position (valve port).

**Configuration of digital inputs**

Required user level: Specialist (4) or higher.

**Example**

DIN4 input to operate to position 1 selecting the shortest path:

**Parameter**: Signal DIN 4 M0118 = Intermediate pos. 1

<table>
<thead>
<tr>
<th>Setting values for digital inputs (DIN)</th>
<th>Operation behaviour for input control</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intermediate pos. 1 to Intermediate pos. 12</td>
<td>Operation to defined position while selecting the shortest path</td>
</tr>
<tr>
<td>MPV: CW Position 1 to MPV: CW Position 10</td>

<td>Actuator operation in clockwise direction (without stop at any position)</td>
</tr>
<tr>
<td>MPV: DriveCCW</td>
<td>Actuator operation in counterclockwise direction (without stop at any position)</td>
</tr>
</tbody>
</table>

### 8.9.9. Dead band

The dead band prevents operation to a new setpoint position within a specified band.

Required user level: Specialist (4) or higher.

**Customer settings** M0041

| Multiport valve M1140 |
| Reduction ratio M1143 |

**Default value**: 0.00°

**Setting range**: 0.00 – 36.0° (degrees)

### 8.9.10. Backlash compensation

Adjustable backlash compensation of the overall system including valve coupling.

Required user level: Specialist (4) or higher.

**Customer settings** M0041

| Multiport valve M1140 |
| Backlash comp. M1146 |

**Default value**: 0.00°
8.9.11. Signalling behaviour of positions: set/check

Reaching of a point (valve port) can be signalled:

- via indication lights (LEDs) of the local controls or (refer to chapters <Indications> <Indication lights>)
- via output contacts (refer to chapters <Indications> <Assignment of outputs>)

Signal behaviour, this means the signal behaviour upon reaching a position, is set via parameter Signal behaviour.

<table>
<thead>
<tr>
<th>M</th>
<th>Customer settings M0041</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Multiport valve M1140</td>
</tr>
<tr>
<td></td>
<td>Signal behaviour M1147</td>
</tr>
</tbody>
</table>

Default value: No signal

Setting values:

- A: Signal behaviour Off. Position is not signalled.
- B: Signal is active from reaching the position up to 360°.
- C: Signal is active from 0° until the position is reached.
- D: When passing the position, a pulse signal is issued. The pulse range (range +/- around the pivot point) depends on the set hysteresis.

Figure 52: Signal behaviour of positions

Information: The set signal behaviour is valid for all positions.

The hysteresis determines the tripping point.

Example
- Parameter Position 4 M1153 is set to 180° (50 % of the travel).
- Parameter Hysteresis M1148 is set to 3.0°.
Figure 53: Switching behaviour for signalling behaviours B, C, D and hysteresis 3.0°.

P1 Switch-on point (●)
P2 Switch-off point (○)
pT Pulse duration = 2 times XT + hysteresis

Required user level: AUMA (6).

M ▶ Customer settings M0041
Multiport valve M1140
Hysteresis M1148

Default values: 0.5° for all 10 intermediate positions
Setting range: 0.0° to 5.0° (degree)

8.10. Automatic de-blocking

— Option —

Requirements
This function requires one of the following equipments within the actuator:

- MWG (Non-Intrusive version)
- Electronic position transmitter EWG/RWG

This function CANNOT be combined with the functions listed below:

- Lift Plug Valve
- By-pass function
- Operation profile
- If the setting range was limited for the positioner (parameter Limit setting range M0845 = Function active)

For actuator controls in SIL version, we DISADVISE using the automatic de-blocking function.

⚠️ NOTICE ⚠️

Unexpected starting of actuator!

*When using automatic de-blocking with level-controlled operation command evaluation, unexpected starting of actuator into the wrong direction might occur when trying to eliminate a double-sided torque fault (torque faults in directions OPEN and CLOSE are present at the same time).*

→ Use automatic de-blocking only in combination with edge controlled operation command evaluation (parameter Com. eval. REMOTE M1709).

Characteristics
In case of torque switch tripping in intermediate position (i.e. prior to reaching the end position), the actuator automatically attempts to reach the end position by operation into the opposite direction and executing the actual operation command once again.
The torque fault signal is suppressed during automatic deblocking. Should torque switching trip again once automatic deblocking is complete, the actuator is switched off and AC controls signal a torque fault.

8.10.1. Automatic deblocking function: activate

Required user level: Specialist (4) or higher.

M ▶ Device configuration M0053
  Application functions M0178
  Activation M0212
  MPV function M1679

Default value: Function not active

Setting values:

- Function not active: Function deactivated.
- Function active: Function activated.

8.10.2. Operation time for operation in opposite direction: set

The actuator controls remember the first seating position and operates the actuator for the set operation time into opposite direction.

Required user level: Specialist (4) or higher.

M ▶ Customer settings M0041
  Automatic deblocking M1680
  Oper. time opposite M1681

Default value: 3 s

Setting ranges: 1 ... 60 s (seconds)

8.10.3. Number of deblocking attempts: set

Required user level: Specialist (4) or higher.

M ▶ Customer settings M0041
  Automatic deblocking M1680
  Deblocking attempts M1682

Default value: 3

Setting ranges: 1 ... 5

8.10.4. Tolerance range: set

Tolerance range (+/-) for original torque seating position, within which a torque fault will be signalled after unsuccessful automatic deblocking.

Required user level: Specialist (4) or higher.

M ▶ Customer settings M0041
  Automatic deblocking M1680
  Tolerance range M1683

Default value: 10 %

Setting ranges: 5 ... 30 % (percentage of operating time into opposite direction)

8.11. Heater system and heaters

Possible components:
- Heater system within the actuator controls
- Heaters within the actuator:
  - Control unit heater in switch compartment
  - Motor heater (within motor housing)
8.11.1. Heater system within the actuator controls

The heater system is generally used for low temperature (in low temperature version up to \(-60 ^\circ C\)). For an installed heater system, the other heaters (control unit, motor heater) will also be connected to the heater system.

Wiring diagram designation: R5 H

Marking of variants within the wiring diagram code (position 11)
- **B** = 115 V AC or 230 V AC externally supplied
- **C, E, H** = internally supplied via actuator controls

The heater system is temperature-controlled. The heater system will automatically be activated for a temperature range between \(-5 ^\circ C\) and \(-10 ^\circ C\) and ensures that the temperature within the controls housing does not fall below \(-20 ^\circ C\).

8.11.2. Heater on control unit (actuator)

**Characteristics**
For AUMA actuators with AC actuator controls, a resistance type heater is installed on the control unit (within actuator switch compartment).

The heater minimises condensation within the actuator switch compartment.

Wiring diagram designation: R1 H

Marking within the wiring diagram code: position 11 = A – H

**Information**
The proper function of the heater can be monitored. For further information, refer to <Heater system/heater monitoring>.

**Activate/deactivate heater on control unit**
The heater on the control unit of the actuator can be activated/deactivated. Activation/deactivation can either be permanent or automatically when exceeding/falling short of defined temperature values. An electronic control unit (MWG) is required for automatic setting.

**Information**
If the heater is deactivated, heater monitoring is also deactivated (parameter Heater monitor)!

Required user level: Specialist (4).

**Device configuration**
- **M0053**
- **M0168**
- **M1338**

**Default value:** On

**Setting values:**
- **Off**
  - Heater is deactivated.
- **On**
  - Heater is activated.
- **Auto**
  - Heater is automatically activated/deactivated by the actuator controls:
    - For temperatures exceeding +40 \(^\circ C\) within the switch compartment = deactivated
    - For temperatures of less than +35 \(^\circ C\) within the switch compartment = activated

8.11.3. Motor heater

The motor heater minimises condensation within the motor and improves the start-up behaviour for extremely low temperatures.

Wiring diagram designation: R4 H

Marking within the wiring diagram code: position 11 = D (motor heater externally supplied), G (motor heater internally supplied)
9. Failure functions

**Definition**
Failure functions are started by certain events and lead to a defined action of the controls or the actuator. A failure operation can be started by a manual action (e.g. pressing an EMERGENCY stop button). In general, a failure operation is automatically started by a fault signal from a monitoring function (e.g. loss of signal).

### 9.1. Reversing prevention time

**Application**
Prevention of impermissible operation states such as: Operation command in direction OPEN, actuator still runs in direction CLOSE due to the delay time.

**Characteristics**
The reversing prevention time (off-time between two operation commands in opposite direction) prevents a restart for a defined interval once the motor has switched off.

**Parameters and instructions for setting**

- **Required user level:** AUMA (6).
- M ▶ Device configuration M0053
  - Switchgear M0173
  - Revers. prevent. time M0174
- **Default value:** 0.3 s seconds
- **Setting range:** 0.1…30.0 s seconds

### 9.2. Failure behaviour on loss of signal

**Characteristics**
The failure behaviour can be used to define AC reaction to loss of signal or a defective signal.

Only in operation mode Remote will the failure behaviour react to a signal loss. In operation modes Local or Off, there will be no reaction.

#### 9.2.1. Failure behaviour initiation on loss of signal

- **Required user level:** Specialist (4) or higher.
- M ▶ Customer settings M0041
  - Failure behaviour M0378
  - Signal loss beh. M0379
- **Default value:** Good signal first
- **Setting values:**
  - **Good signal first**
    - The <Failure behaviour> is only initiated if the monitored signal fails (falling edge).
    - This setting ensures that if the signal is missing, the actuator will not start when switching on (Good signal first).
  - **Immediately active**
    - The <Failure behaviour> is immediately initiated if the monitored signal is missing (is not present).

  **For the setting Immediately active:**
  - **CAUTION**
    - The actuator can start immediately when switching on!
    - Risk of personal injuries or damage to the valve.
    - Ensure that the signal set under parameter Failure beh. source M0385 is present when switching on.
    - Should the actuator start unexpectedly: Immediately set selector switch to position Local control (LOCAL) or 0 (OFF).

#### 9.2.2. Failure source (failure reason) for a failure operation: set

- M ▶ Customer settings M0041
  - Failure behaviour M0378
  - Failure beh. source M0385
Default value: I/O interface

Setting values:

I/O interface

The failure behaviour is initiated in case of loss of setpoints.

The monitoring depends on the preset setpoint range, e.g.:

- Setpoint = 4 – 20 mA, E1 lower than 3.7 mA = loss of signal
- Setpoint = 10 – 20 mA, E1 lower than 9.7 mA = loss of signal

For a setpoint range of 0 – 20 mA, monitoring is not possible.

9.2.3. Failure operation (reaction of the actuator) on loss of signal

The failure operation determines which action is executed by the actuator once the failure behaviour is initiated.

Default value: STOP

Setting values:

- STOP: The actuator stops in the current position.
- CLOSE: The actuator runs to end position CLOSED.
- OPEN: The actuator runs to end position OPEN.

Approach position

The actuator runs to the predetermined position. Conditions:

- The function <Positioner> is activated.
- Parameter Failure beh. source M0385 is set to I/O interface

Execute last CMD

The actuator executes the last operation command before it is stopped.

If the last operation command was a setpoint definition via analogue input (AIN 1/AIN 2), the lower limit of the setpoint position is used (parameter Low limit AIN 1/Low limit AIN 2). The actuator is operated to the defined end position, usually end position CLOSED.

Behaviour depending on the selector switch position:

Once the failure operation is triggered, the defined position is approached. If the actuator is then moved to another position (e.g. by manual operation), it will try to perform the set failure operation while the selector switch is in position Remote control (REMOTE).

Information

To prevent a new approach to the failure position during manual operation, the selector switch must be set to position Local control (LOCAL) or 0 (OFF) prior to operating the handwheel.

9.2.4. Failure position: define

If the failure operation Approach position is set, the actuator moves to the failure position indicated here.

Required access level: Specialist (4) or higher.

Default value: 50.0%

Setting range: 0.0 ... 100.0% (from end position OPEN to CLOSED)

9.2.5. Failure position MPV: define

This parameter is only available in multiport valve version.
If the Approach position failure operation is set, the actuator runs to the preset failure position indicated here.

Required user level: Specialist (4) or higher.

**M > Customer settings M0041**
- Failure behaviour M0378
- Failure position MPV M1172

**Default value:** 0.0°
**Setting range:** 0.0°...360°

### 9.2.6. Delay time: set

A failure operation is only performed once the delay time has expired. This prevents a short-term loss of signal, which does not have an effect on the process, from directly starting a failure operation.

Required user level: Specialist (4) or higher.

**M > Customer settings M0041**
- Failure behaviour M0378
  - Delay time M0386

**Default value:** 3.0 s
**Setting range:** 0.0 s...1,800.0 s seconds

### 9.3. EMERGENCY behaviour

**Application**
The EMERGENCY behaviour can be used to determine the actuator behaviour in an emergency.

**Characteristics**
- The function <EMERGENCY behaviour> is initiated by the EMERGENCY signal.
- The actuator performs a defined EMERGENCY operation. For example, the actuator moves to a predefined EMERGENCY position (i.e. end position OPEN or end position CLOSED).
- As long as the EMERGENCY signal is present, the actuator does not respond to any other operation commands (EMERGENCY signal has top priority).
- After initiating the EMERGENCY behaviour, binary operation commands (via digital inputs) may have to be sent again.
- Analogue operation commands (e.g. 0/4 – 20 mA) are immediately executed again.

**Condition**
For the function <EMERGENCY behaviour>, a digital input for the signal EMERGENCY has to be available and configured.

**Configuration of digital input**
Required access level: Specialist (4).

**M > Device configuration M0053**
- I/O interface M0139
  - Digital inputs M0116

**Example**
Use input DIN 4 for signal EMERGENCY:

**Parameter:** Signal DIN 4 M0118
**Setting value:** EMERGENCY (wiring diagram designation: EMERGENCY)

**Information**
The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 4 M0126), the input is either High active or Low active. For safety reasons, the EMERGENCY signal input is generally set to Low active.
Perform EMERGENCY operation via digital input

Switching behaviour for coding Low active:
- Input EMERGENCY = low level (0 V DC or input open-circuit) EMERGENCY operation is initiated.
- Input EMERGENCY = high level (standard: +24 V DC) No EMERGENCY operation

9.3.1. EMERGENCY behaviour: activate

Required user level: Specialist (4) or higher.

Device configuration M0053
Application functions M0178
Activation M0212
EMERGENCY behaviour M0589

Default value: Function not active

Setting values:

Function not active Function <EMERGENCY behaviour> deactivated.
Function active Function <EMERGENCY behaviour> activated.

For activated EMERGENCY behaviour:

The actuator can start its operation due to an EMERGENCY signal.
Risk of personal injuries or damage to the valve.

→ For commissioning and maintenance work: Set selector switch to position 0 (OFF). Motor operation can only be interrupted in this selector switch position.
→ Should the actuator start unexpectedly: Immediately set selector switch to position 0 (OFF).

Information EMERGENCY behaviour must be completely configured during first activation. This means the setting of the following parameters must be adapted to the required actuator behaviour in particular: Failurereaction EMCY EMCYfailuresource EMCY operationmode EMCY operation EMCY position

9.3.2. EMERGENCY failure behaviour

Required user level: Specialist (4) or higher.

Customer settings M0041
EMCY behaviour M0198
Failure reaction EMCY M0203

Default value: Good signal first

Setting values:

Good signal first The <EMERGENCY behaviour> is initiated as soon as the EMERGENCY signal changes from high to low. Example: In case of a binary EMERGENCY input from +24 V DC to 0 V. This prevents the <EMERGENCY behaviour> from being initiated immediately once the AC is switched on and no EMERGENCY signal is present.

Immediately active The <EMERGENCY behaviour> is initiated by a low level at the EMERGENCY signal. For this setting, the EMERGENCY has to have a high level before switching on the AC; otherwise <EMERGENCY behaviour> is initiated immediately after switching on.
For the setting Immediately active:

The actuator can start immediately when switching on!

Risk of personal injuries or damage to the valve.

→ Ensure that the EMERGENCY signal is present when switching on.
→ Should the actuator start unexpectedly: Immediately set selector switch to position 0 (OFF).

### 9.3.3. Failure source (failure reason) for an EMERGENCY operation: set

| M | Customer settings M0041 |
|   | EMCY behaviour M0198 |
|   | EMCY failure source M0591 |

Default value: I/O interface

Setting values:

- **I/O interface**: The EMERGENCY signal is present as binary signal (standard: +24 V DC) at a digital input. If this voltage (i.e. the signal) is no longer present, the EMERGENCY behaviour is initiated.

- **Active interface**: If active interface fails, the EMERGENCY behaviour is initiated; e.g. when changing the command source the failure source for the EMERGENCY signal also fails.

### 9.3.4. Operation mode for EMERGENCY behaviour

The EMERGENCY behaviour can be activated for the operation modes Remote and/or Local

| M | Customer settings M0041 |
|   | EMCY behaviour M0198 |
|   | EMCY operation mode M0202 |

Default value: Remote only

Setting values:

- **Remote only**: EMERGENCY behaviour is active in the operation modes: Remote, Remote II, Fieldbus

- **Remote and local**: EMERGENCY behaviour is active in the operation modes: Remote, Remote II, Fieldbus, Local, Service

Information: In the operation mode Off (selector switch position 0), no emergency operation is performed.

### 9.3.5. EMERGENCY operation

The EMERGENCY operation determines which action is executed by the actuator once the EMERGENCY behaviour is initiated.

| M | Customer settings |
|   | EMCY behaviour |
|   | EMCY operation |

Default value: STOP

Setting values:

- **STOP**: The actuator stops in the current position.
- **CLOSE**: The actuator runs to end position CLOSED.
- **OPEN**: The actuator runs to end position OPEN.
- **Approach EMCY pos.**: The actuator runs to the predetermined position.
9.3.6. **EMERGENCY position**

If the EMERGENCY operation Approach EMCY pos. is set, the actuator moves to the EMERGENCY position entered here.

Required user level: **Specialist (4)** or higher.

- Customer settings M0041
- EMCY behaviour M0198
- EMCY position M0232

**Default value:** 0.0 %

**Setting range:** 0.0 … 100.0 % (from end position OPEN to CLOSED)

9.3.7. **EMERGENCY position MPV**

If the EMERGENCY operation Approach EMCY pos. is set, the actuator runs to the indicated EMERGENCY position of the multport valve.

Required user level: **Specialist (4)** or higher.

- Customer settings M0041
- EMCY behaviour M0198
- EMCY position MPV M1171

**Default value:** 0.0°

**Setting range:** 0.0° ... 360.0° (degree)

9.3.8. **Torque switching: by-pass**

If the EMERGENCY signal initiates an EMERGENCY operation, the torque switching can be by-passed during this operation.

Required access level: **Specialist (4)** or higher.

- Customer settings M0041
- EMCY behaviour M0198
- By-pass torque M0199

**Default value:** Off

**Setting values:**
- Off: No by-pass of the torque switching.
- On: The signals of the torque switching in the actuator are by-passed

9.3.9. **Motor protection: by-pass**

If the EMERGENCY signal initiates an EMERGENCY operation, the motor protection can be by-passed during this operation.

Required user level: **Specialist (4)** or higher.

- Customer settings M0041
- EMCY behaviour M0198
- Thermal by-pass M0200

**Default value:** Off

**Setting values:**
- Off: No by-pass of motor protection.
- On: The signals of the thermoswitches or the PTC thermistors of the motor winding are by-passed.

**Information** It is not possible to by-pass the motor protection for actuators with explosion protection.
9.3.10. Stepping mode: by-pass

If the EMERGENCY signal initiates an EMERGENCY operation, the stepping mode can be by-passed during this operation.

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
</tr>
<tr>
<td>On</td>
</tr>
</tbody>
</table>

9.3.11. Operation profile: by-pass

If the EMERGENCY signal initiates an EMERGENCY operation, the set operation profile (operation behaviour) can be by-passed during this operation.

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
</tr>
<tr>
<td>On</td>
</tr>
</tbody>
</table>

9.3.12. Interlock: by-pass

If the Interlock function is activated, you may by-pass this function during EMERGENCY operation to prevent that an enable command must be issued to perform EMERGENCY operation.

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
</tr>
<tr>
<td>On</td>
</tr>
</tbody>
</table>

9.3.13. Local stop: by-pass

If activated, you may by-pass Local Stop function during an EMERGENCY operation to prevent interruption of EMERGENCY operation by pressing the push button STOP.

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
</tr>
</tbody>
</table>

Actuator controls
AC 01.2/ACExC 01.2
Failure functions
9.3.14. Delay time for EMERGENCY operation

An EMERGENCY operation is only performed once the delay time has expired. Consequently, a short-term signal failure will not have an impact on the process and will not immediately initiate an EMERGENCY operation.

Required user level: Specialist (4) or higher.

M ▶
Customer settings M0041
EMCY behaviour M0198
Delay time M0804

Default value: 00:01.00 min : s
Setting range: 00:00.0 ... 30:00.0 min : s

9.4. Enabling local controls

— Option —

Application
- Protection against unauthorised operation via local controls
- Protection against unauthorised parameter setting via local controls

Characteristics
The selector switch functions LOCAL and/or OFF may be enabled or disabled.

Condition
For the function <Enable local controls>, a digital input for the signal Enable Local has to be available and configured.

Configuration of digital input

Required user level: Specialist (4).

M ▶
Device configuration M0053
I/O interface M0139
Digital inputs M0116

Example
Use input DIN 5 for signal Enable Local:
Parameter: Signal DIN 5 M0122
Setting value: Enable Local (wiring diagram designation: Enable LOCAL)

Information
The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 5 M0127), the input is either High active or Low active. Default setting is High active.

Enable/disable local controls via digital input

Switching behaviour for coding High active:
- Input Enable Local = high level (standard: +24 V DC): Operation via local controls enabled
- Input Enable Local = low level (0 V DC or input open): Operation via local controls disabled

9.4.1. Enabling function: activate

Required user level: Specialist (4) or higher.

M ▶
Device configuration M0053
Application functions M0178
Activation M0212
Enable LOCAL M0631

Default value: Function not active
9.4.2. Enabling function behaviour

The enable behaviour determines which selector switch functions (LOCAL, OFF) require an additional enable signal.

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>Function not active</th>
<th>Function active</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function &lt;Local controls: enable from REMOTE&gt; deactivated.</td>
<td>Function &lt;Local controls: enable from REMOTE&gt; activated.</td>
</tr>
</tbody>
</table>

**M**

Customer settings M0041
- Local controls M0075
- Enable LOCAL M0628

Default value: Sel. sw. Local

**Setting values:**
- Sel. sw. Local: Disabling or enabling is only effective in operation mode LOCAL (selector switch is in position Local control). If no enable signal is present, operation via push buttons on the local controls is disabled and the display shows the following signal: Disabled.
- Sel. sw. Local + Off: Disabling or enabling is effective in operation modes LOCAL and OFF (selector switch positions Local control and Off). If no enable signal is present, operation via push buttons on the local controls is disabled and the display shows the following signal: Disabled.

9.5. Priority REMOTE

— Option —

**Characteristics**
A control signal can provide REMOTE control with priority over actuator operation via local controls (irrespective of the selector switch position)

This function uses the same input signal as the <Enabling local controls> function.

**Application**
No changing possibility via selector switch from LOCAL

**Condition**
For the <Priority REMOTE> function, a digital input for the signal Enable Local has to be available and configured.

**Configuration of digital input**

Required user level: Specialist (4).

**M**

Device configuration M0053
- I/O interface M0139
- Digital inputs M0116

**Example**
Use input DIN 5 for signal Enable Local:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Setting value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Signal DIN 5 M0122</td>
<td>Enable Local (wiring diagram designation: Enable LOCAL)</td>
</tr>
</tbody>
</table>

**Information**
The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 5 M0127), the input is either High active or Low active. Default setting is High active.

**Priority REMOTE via digital input**

**Switching behaviour for coding High active:**
- Input Enable Local = high level (standard: +24 V DC): Operation via local controls enabled
- Input Enable Local = low level (0 V DC or input open): Priority REMOTE: Operation via local controls disabled
9.5.1. Priority REMOTE: activate

Required user level: Specialist (4) or higher.

- **Device configuration** M0053
  - Application functions M0178
  - Activation M0212
  - Priority REMOTE M0770

Default value: Function not active

Setting values:

- **Function not active** <Priority REMOTE> function is deactivated.
- **Function active** <Priority REMOTE> function is activated.

9.5.2. Priority REMOTE behaviour

This function determines which selector switch functions (LOCAL, OFF) require an additional enable signal.

Required user level: Specialist (4) or higher.

- **Customer settings** M0041
  - Local controls M0075
  - Priority REMOTE M0773

Default value: Sel. sw. Local

Setting values:

- **Sel. sw. Local** Priority of control from REMOTE is only effective in operation mode LOCAL (selector switch is in position Local control). If no enable signal is present, operation via push buttons on the local controls is disabled, the actuator can be controlled from REMOTE and the controls indicate the symbol in the status line of the display (menu S0001).

- **Sel. sw. Local + Off** Priority of control from REMOTE is effective in operation modes LOCAL and OFF (selector switch positions Local control and Off). If no enable signal is present, operation via push buttons on the local controls is disabled, the actuator can be controlled from REMOTE and the controls indicate the symbol in the status line of the display (menu S0001).

9.6. Interlock (enabling operation commands)

--- Option ---

**Characteristics**
- An operation command will only be executed if an additional release signal for the operation command is present.
- Enabling may be activated or deactivated individually for operation commands OPEN and CLOSE.
- Enabling can be set for the different operation modes.

**Condition**
For the function <Interlock>, a digital input for the signal Enable CLOSE has to be available and configured.

**Configuration of digital input**

Required user level: Specialist (4).

- **Device configuration** M0053
  - I/O interface M0139
  - Digital inputs M0116

**Example**
Use input DIN 5 to enable operation commands in direction CLOSE:

- **Parameter**: Signal DIN 5 M0122
- **Setting value**: Enable CLOSE (wiring diagram designation: Interlock CLOSE)
The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 5 M0127), the input is either High active or Low active. Default setting is High active.

### Enable/disable commands via digital input

**Switching behaviour for coding High active:**

- Input \textit{Enable OPEN} = \textit{low level} (0 V DC or input open): Operation command enabled.

### 9.6.1. Interlock: activate

Required user level: Specialist (4) or higher.

**M ▶**

- Device configuration M0053
- Application functions M0178
- Activation M0212
- Interlock M0663

**Default value:** Function not active

**Setting values:**

<table>
<thead>
<tr>
<th>Setting values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function not active</td>
<td>Function &lt;Interlock (enable operation commands)&gt; deactivated.</td>
</tr>
<tr>
<td>Function active</td>
<td>Function &lt;Interlock (enable operation commands)&gt; activated.</td>
</tr>
</tbody>
</table>

### 9.6.2. Failure source of Interlock enable signal: set

**M ▶**

- Customer settings M0041
- Interlock M0664
- Interlock failure source M1013

**Default value:** Active comm. source

**Setting values:**

<table>
<thead>
<tr>
<th>Setting values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Active comm. source</td>
<td>Signals for enabling operation commands are sent via the active interface. I.e. changing the command source also changes the failure source of the enable signal.</td>
</tr>
<tr>
<td>Interface</td>
<td>The enable signal for the operation commands must be configured as binary signal (default: +24 V DC) at a digital input (parameter: Enable OPEN/Close).</td>
</tr>
</tbody>
</table>

### 9.6.3. Operation mode for interlock

The additional enable signal can be activated for different operation modes.

**M ▶**

- Customer settings M0041
- Interlock M0664
- Oper. mode Interlock M0665

**Default value:** Off both directions

**Setting values:**

<table>
<thead>
<tr>
<th>Setting values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Off</td>
<td>Interlock is off.</td>
</tr>
<tr>
<td>Remote</td>
<td>Interlock is active in operation modes: Remote, Remote II, Fieldbus</td>
</tr>
<tr>
<td>Local</td>
<td>Interlock is active in operation modes: Local, Service</td>
</tr>
<tr>
<td>Remote and local</td>
<td>Interlock is active in operation modes: Remote, Remote II, Fieldbus, Local, Service</td>
</tr>
</tbody>
</table>

### 9.6.4. Interlock behaviour (running direction)

The Interlock behaviour determines which selector switch functions (LOCAL, OFF) require an additional enable signal.

Required user level: Specialist (4) or higher.
### 9.7. Local Stop

**— Option —**

**Characteristics**
- The function Local Stop can be used to stop an operation from Remote locally with the push button STOP.
- All operation commands are interrupted.

**Information**
After releasing push button STOP, an operation command which might still be present will become active immediately.

#### 9.7.1. Behaviour

Required user level: **Specialist (4)** or higher.

**Setting values:**
- **Off**
  - Push button STOP can only interrupt an operation in operation mode **Local** (selector switch = position **Local control**).

**Sel.sw.Local + Remote**
In the operation modes **Local**, **Remote**, **Remote II**, **EMERGENCY** and **Service**, push button STOP interrupts an operation.

**Information**
In operation mode **Disabled**, an interruption is NOT possible.

### 9.8. EMERGENCY stop function

**— Option —**

**Conditions**
An EMERGENCY stop button (latching) is either located on the electrical connection or outside.

**Characteristics**
- In an emergency, the EMERGENCY stop button can be used to interrupt the power supply of the motor control (contactors or thyristors). Possibly present operation commands with self-retaining will be reset.
- The indication in the top row of the display shows: **EMCY stop**
Information

- The EMERGENCY stop button is intended for operation in an emergency. For maintenance work, the mains supply of the AC has to be switched off and protected against accidental switching on.
- The EMERGENCY stop button is not available for the ACExC, but only for the weatherproof versions of the AC.

Operation commands

After having unlocked the EMERGENCY stop button, a possibly active operation command will NOT immediately be re-activated, but only respective acknowledgement by the operator. This resets the EMERGENCY stop status.

The acknowledgement is made:

- via the RESET push button in selector switch position Local control (LOCAL).
- via a digital input from Remote. Assignment: RESET

9.9. Partial Valve Stroke Test (PVST)

— Option —

Characteristics

The Partial Valve Stroke Test (PVST) is used to check the function of both actuator and actuator controls. During this test, the function of the valve is tested by means of partial opening or closing within a defined period of time without interrupting the process. After successful testing, actuator controls operate the actuator to its initial position.

If the test was not successful, actuator controls will generate the following signals: PVST fault PVST abort For monitoring the PVST, these signals must be evaluated by a PLC.

Requirements

- Position transmitter in the actuator
- Function <Positioner> activated.
- If the actuator is in safe state (caused by the failure behaviour), the test will not be performed.
- The test can only be performed during OPEN - CLOSE control. For setpoint control (modulating duty), a test cannot be performed.

For the change-over, a digital input for the signal Execute PVST has to be available and configured.

Configuration of digital input

Required user level: Specialist (4).

M ▶ Device configuration M0053
I/O interface M0139
Digital inputs M0116

Example

Use input DIN 5 for Execute PVST signal:

Parameter: Signal DIN 4 M0118
**Setting value:** Execute PVST (wiring diagram designation: ESD)

The logic for the digital inputs may be inverted. Depending on the parameter setting (e.g. Coding DIN 4 M0126), the input is either High active or Low active. For safety reasons, the Execute PVST signal input is generally set to Low active.

### Execute PVST via digital input

**Switching behaviour for coding Low active:**
- Input Execute PVST = low level (0 V DC or input open) No test
- Input Execute PVST = high level (standard: +24 V DC): Test is initiated

### Execute PVST manually via push buttons of the local controls

Required user level: Specialist (4) or higher.

- **Device configuration** M0053
- **Service functions** M0222
- **Execute PVST** M0850

The actuator is within the set stepping range. The initial position depends on the settings of the following parameters: PVST behaviour M0853, PVST stroke M0854

### Information

PVST can be stopped by sending a Reset command.
- local (manual), in selector switch position local operation, via push button Reset.
- From Remote, in selector switch position Remote control via a digital input. Assignment: RESET

#### 9.9.1. PVST: activate

Required user level: Specialist (4) or higher.

- **Device configuration** M0053
- **Application functions** M0178
- **Activation** M0212
- **PVST** M0851

**Default value:** Function not active

**Setting values:**
- Function not active: <PVST> function deactivated.
- Function active: <PVST> function activated.

#### 9.9.2. Operation mode for PVST

Required user level: Specialist (4) or higher.

- **Customer settings** M0041
- **PVST** M0852
- **PVST operation mode** M0889

**Default value:** Stroke

**Setting values:**
- **Stroke** Stroke controlled PVST; operation across defined stroke (parameter PVST stroke) within a defined time (parameter PVST monitoring). In this operation mode, the PVST can be started in any valve position (even outside the end position).
- **End position test** Operating time controlled PVST; operation within a defined time (parameter PVST operating time) after leaving an end position. In this operation mode, PVST can only be started from one of the end positions.
9.9.3. **Behaviour for PVST: define**

The test can be performed in direction OPEN or direction CLOSE.

- **Customer settings** → M041
  - **PVST** → M0852
  - **PVST behaviour** → M0853

  **Default value:** OPEN

  **Setting values:**
  - OPEN: Testing by operation in direction OPEN.
  - CLOSE: Testing by operation in direction CLOSE.

9.9.4. **Partial stroke for PVST: set**

During stroke controlled PVST execution (parameter PVST operation mode M0889 = Stroke), this parameter determines the partial stroke for a PVST.

Usually, the valve stroke amounts to 10 to 15 %. The amount of the partial stroke depends on process requirements and the required diagnostic coverage rate.

- **Customer settings** → M041
  - **PVST** → M0852
  - **PVST stroke** → M0854

  **Default value:** 10.0 %

  **Setting range:** 0.0 ... 100.0 %

9.9.5. **PVST monitoring time: set**

The actuator remains in the current position, if the test could not be completed within the pre-set time.

- **Customer settings** → M041
  - **PVST** → M0852
  - **PVST monitoring** → M0855

  **Default value:** 01:00.0 min:s (1 minute)

  **Setting range:** 00:01.0 ... 50:00.0 min:s (minutes:seconds)

9.9.6. **PVST operating time: set**

During operating time controlled PVST execution (parameter PVST operation mode M0889 = End position test), this parameter determines the permissible PVST operating time.

- **Customer settings** → M041
  - **PVST** → M0852
  - **PVST operating time** → M0890

  **Default value:** 00:02.0 min:s (2 Sekunden)

  **Setting range:** 00:00.1 ... 15:00.0 min:s (minutes:seconds)

9.9.7. **PVST reverse time: set**

Waiting time during PVST prior to returning to initial position.

- **Customer settings** → M041
  - **PVST** → M0852
  - **PVST reversing time** → M0891

  **Default value:** 00:02.0 min:s (2 seconds)

  **Setting range:** 00:00.1 ... 15:00.0 min:s (minutes:seconds)
9.9.8. PVST reminder

If this function is active, a signal is generated if no PVST was executed during the reminder period.

**Activate reminder**

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>M ▷ Customer settings M0041</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVST M0852</td>
</tr>
<tr>
<td>PVST reminder M0892</td>
</tr>
</tbody>
</table>

**Default value:** Function not active

**Setting values:**

- **Function not active**: Reminder not activated.
- **Function active**: Reminder activated.

**Set reminder period**

<table>
<thead>
<tr>
<th>M ▷ Customer settings M0041</th>
</tr>
</thead>
<tbody>
<tr>
<td>PVST M0852</td>
</tr>
<tr>
<td>PVST reminder period M0893</td>
</tr>
</tbody>
</table>

**Default value:** 0 d

**Setting range:** 0 ... 65535 d (days)
10. Monitoring functions

Definition
The monitoring functions signal a warning or a fault as soon as a certain value is outside the permissible range. Faults generally cause an actuator shutdown.

10.1. Torque monitoring
Torque monitoring has the following functions:
- Valve overload protection against excessive torques (leads to switching off)
- Torque warning before overload protection tripping (only in combination with electronic control unit in the actuator)

Overload protection
Once the overload protection trips (torque exceeds set tripping torque), the actuator is stopped.

The controls generate a fault indication if:
- the excessive torque occurs between end positions
- the excessive torque occurs in the end positions and limit seating is set.

The fault indication is shown in the display
- Status indications: S0007 Fault or S0011 Failure
  - Details: Torque fault CLOSE or Torque fault OPEN

The fault has to be acknowledged before the operation can be resumed:
1. either by an operation command in the opposite direction.
   - For Torque fault CLOSE: Operation command in direction OPEN
   - For Torque fault OPEN: Operation command in direction CLOSE
2. or, in case the torque applied is lower than the preset tripping torque after tripping:
   - via the RESET push button in selector switch position Local control (LOCAL).

Depending on the version, tripping torques for overload protection are either set via switches in the actuator or via software parameters in the controls. For the settings, refer to <Torque switching> chapter.

Torque warning
Requirements
Actuator with electronic control unit (MWG).

The torque warning can be used e.g. for self-monitoring or for anticipating maintenance requirements.

Customer settings M0041
Torque switching M0013
Wrntorque CLOSE M0769
Wrntorque OPEN M0768

Default value: 80 %
Setting range: 20 ... 100 % of the set nominal torque

When exceeding the set limit values, the actuator is not stopped, however, the controls generate a warning signal:
- Status indications: S0005 Warnings or S0008 Out of specification
  - Details: Torque wrn CLOSE or Torque wrn OPEN

Torque by-pass
By means of the torque by-pass, the torque monitoring is deactivated for a defined (short) time. During this interval, the full actuator torque may be used, for example, to release the actuator from a jammed end position or any other jammed position.
Valve damage due to excessive torque!

→ Only apply torque by-pass with the consent of the valve manufacturer.

**Customer settings M0041**
**Torque switching M0013**
**Torque by-pass M0092**

Default value: Function not active

<table>
<thead>
<tr>
<th>Setting values:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Function active</td>
</tr>
<tr>
<td>The torque by-pass is activated.</td>
</tr>
<tr>
<td>Function not active</td>
</tr>
<tr>
<td>The torque by-pass is deactivated.</td>
</tr>
</tbody>
</table>

**Time interval for torque by-pass**

During the time interval set here, the torque monitoring is deactivated.

**Customer settings M0041**
**Torque switching M0013**
**Torque by-pass [s] M0205**

Default value: 0.0 s

Setting range: 0.0 ... 5.0 s seconds

**Information**

If torque by-pass is activated, the interval should be longer than the set time period for reversing prevention time to ensure torque by-pass will also be effective in the event of reversal of operation.

### 10.2. Motor protection monitoring (thermal monitoring)

In order to protect against overheating and impermissibly high temperatures at the actuator, PTC thermistors or thermoswitches are embedded in the motor winding. The thermoswitch is tripped as soon as the max. permissible winding temperature has been reached.

The actuator is switched off and the following signals are given:

- LED 3 (motor protection tripped) on the local controls is illuminated.
- Status indication: S0007 Fault or S0011 Failure
  - Details: Thermal fault

The motor has to cool down before the operation can be resumed.

Depending on the parameter setting (motor protection behaviour), the fault signal is either automatically reset or the fault signal has to be acknowledged manually.

Manual acknowledgement can be made:

- in selector switch position Local control (LOCAL) via push button RESET.
- in selector switch position Remote control (REMOTE) via a digital (I/O interface) with the RESET command if a digital input is configured for signal.

In addition, the AC cyclically (once per day) checks the motor protection monitoring for its proper function. If this check fails, the controls generate the fault indication: IE mot. prot. monitor

**Motor protection behaviour**

Required user level: AUMA (6).

**Device configuration M0053**
**Actuator M0168**
**Motor prot. mode M0169**

Default values:

Non-explosion-proof actuators = Auto
Explosion-proof actuators = **Reset**

**Setting values:**

**Auto**
Automatic reset after the motor has cooled down.
Not possible for explosion-proof version ACExC 01.2

**Reset**
Manual reset.
Once the motor has cooled down, the fault has to be acknowledged (reset) manually as described above.
If required the thermal overload relay has to be reset manually. To this end, remove the cover on the back of actuator controls and operate the reset button on the thermal overload relay.

### 10.3. Type of duty monitoring (motor starts and running time)

This function monitors the permissible type of duty (e.g. S2 - 15 min) of the actuator.

For this, controls monitor possible excess of
- permissible motor starts (cycles) per hour
- permissible running time (on-time) per hour

If any of these values has been exceeded, the actuator will however not be stopped, but the following warning signals are issued.
- Status indications: **S0005** or **S0008**
  - Details: **Wrn on time starts**
- Status indications: **S0005** or **S0008**
  - Details: **Wrn on time running**

The warning signals will automatically be cleared if the permissible motor starts per second or the permissible running time per hour are no longer reached.

The operational info logger records the number of excesses (warnings) as well as the number of motor starts and motor running times.

**Example:**
Due to excess of defined starts/h or defined running time/h, the AC issues in total 4 on time warnings: two for 5 min, once for 10 min, once for 17 min. Afterwards the operating data counters contain the following values:

**On time warning 1 M0325** = 37 min = total of all periods (5+5+10+17 min)

**On time warning 2 M0326** = 17 min = longest period

*Figure 55: Example*

**Activate on time monitoring**

Required user level: **Specialist (4)** or higher.

**Customer settings M0041**
**On time monitoring M0355**
### 10.4. Operating time monitoring

This function allows the monitoring of the operating time of the actuator. If the actuator needs longer than the set time to move from end position OPEN to end position CLOSED, a warning is signalled (the actuator is not stopped):

- **Status indication** S0005 Warnings
  - **Details**: Op. time warning

The warning indication is automatically cleared once a new operation command is executed.

When the actuator moves from an intermediate position to an end position, the set monitoring time for the whole stroke is assigned in relation to the remaining stroke/travel.

**Operation mode: activate**

Required access level: Specialist (4) or higher.

**Set permissible operating time manually**

Required user level: Specialist (4) or higher.
**10.5. Reaction monitoring**

The AUMATIC monitors whether the actuator moves after an operation command. If no reaction is recorded at the output drive of the actuator within a set time, either a warning or a fault signal is generated depending on the setting:

- **Status indications:** S0005 Warnings or S0008 Out of specification
  - Details: Wrnn no reaction

- **Status indications:** S0007 Fault or S0011 Failure
  - Details: Fault no reaction

In the event of a fault signal, the fault has to be acknowledged to be able to resume the operation. The acknowledgement is made:

- in selector switch position **Local control** (LOCAL) via push button RESET.
- in selector switch position **Remote control** (REMOTE) via a digital (I/O interface) with the RESET command if a digital input is configured for signal.

In case of operation from an intermediate position, reaction monitoring will only be performed if the actuator is equipped with a position feedback.

**Activate switching off for reaction time error**

Required user level: Specialist (4) or higher.

<table>
<thead>
<tr>
<th>M &gt;</th>
<th>Customer settings M0041</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Reaction monitoring M0632</td>
</tr>
<tr>
<td></td>
<td>Actuator behaviour M0633</td>
</tr>
</tbody>
</table>

**Default value:** No cut-off

**Setting values:**

- **No cut-off** The reaction monitoring only issues a warning.
- **Cut-off** The reaction monitoring issues a fault signal, the actuator is stopped.

**Set reaction time**

<table>
<thead>
<tr>
<th>M &gt;</th>

</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Reaction monitoring M0632</td>
</tr>
<tr>
<td></td>
<td>Reaction time M0634</td>
</tr>
</tbody>
</table>

**Default value:** 15.0 s

**Setting range:** 15.0 ... 300.0 seconds (0 seconds up to 5 minutes)

---

**10.6. Motion detector**

--- Option ---

**Requirements** Position transmitter in the actuator.

**Characteristics** The motion detector checks whether the actuator moves even without operation command (e.g. in manual operation or if there is no self-retaining).

Controls identify motion if the actuator moves more than the pre-set travel difference within the predefined recording time. Controls signal: Output drive rotates

**Information** Parameters for motion detection have a direct impact on reaction monitoring.

**10.6.1. Motion detector: activate**

Required user level: Specialist (4) or higher.
Customersettings M0041
Motion detector M0676
Motion detector M0675

Default value: Function active

Setting values:
- Function not active: Monitoring is deactivated.
- Function active: Monitoring is activated.

### 10.6.2. Detection time dt

Required user level: Specialist (4) or higher.

M > Customer settings M0041
Motion detector M0676
Detect. time dt M0677
Detect. time dt (MWG) M0681

Default values:
- Detect. time dt (for potentiometer/EWG/RWG within actuator) = 00:05.0 min:s (5 seconds)
- Detect. time dt (MWG) (for MWG within actuator) = 00:00.5 min:s (0.5 seconds)

Setting ranges:
- Detect. time dt = 00:01.0 ... 30:00.0 min:s (minutes:seconds)
- Detect. time dt (MWG) = 00:00.1 ... 00:02.0 min:s (minutes:seconds)

### 10.6.3. Travel difference dx

Required user level: Specialist (4) or higher.

M > Customer settings M0041
Motion detector M0676
Travel diff. dx M0678
Travel diff. dx (MWG) M0679

Default values:
- Travel diff. dx (for potentiometer/EWG/RWG within actuator) = 1.0%
- Travel diff. dx (MWG) (for MWG within actuator) = 3 (increments)

Setting ranges:
- Travel diff. dx = 1.0 ... 10.0 %
- Travel diff. dx (MWG) = 2 ... 20 (increments)

### 10.6.4. Delay time

Delay time of the signal: Handwheel oper.

Required user level: Specialist (4) or higher.

M > Customer settings M0041
Motion detector M0676
Delay time M0764

Default value: 6.000 s (seconds)

Setting range: 0.001 ... 65.535 s

### 10.7. Monitoring of electronics power supply

AC actuator controls monitor the following voltages and signals a warning (refer to <Fault signals and warnings> chapter):
- Auxiliary voltage 24 V DC, e.g for supplying the control inputs
- Voltage 24 V AC for controlling the reversing contactors, for thermoswitches and heater within the actuator and for generating the 115 V AC auxiliary voltage for the customer (option)
- Internal 24 V DC power supply of the electronics components (within the controls and in the actuator)
- External 24 V DC supply of the electronics (option)

**Activate monitoring of auxiliary voltage 24 V DC**

Required user level: **Specialist (4)**.

| M ▶ | Device configuration | Monitoring functions M0645  
Monitor 24 V DC cust: M0650 |

<td></td>
<td>Function not active</td>
<td></td>
</tr>
<tr>
<td></td>
<td>On</td>
<td>Monitoring is activated. Should the external supply 24 V DC fail, a warning will be issued.</td>
</tr>
</tbody>
</table>

**Default value:** Function not active

**Setting values:**

**10.8. Temperature monitoring**

**Characteristics**

If the respective sensors are installed in the devices, the AUMATIC monitors different temperatures.

If certain temperature limits are exceeded or fallen short of, the controls either send a warning or a fault signal.

**Conditions:**
- for temperature within the control unit of the actuator: MWG (magnetic limit and torque transmitter)
- For motor temperature: additionally temperature sensor (PT 100) in the motor
- For gear housing temperature: additionally temperature sensor (PT 100) in the gearing

**Information**

Current device temperatures can also be displayed. Refer to <Display device temperatures>.

**10.9. Heater system/heater monitoring**

The heater system within the actuator controls housing and the heater on the control unit (within the switch compartment of the actuator) can be monitored. If the monitoring is activated the following warning will be generated if the heater system or the heater (circuit = interrupted) fails:

- In the display of the local controls, status indication S0005 Warnings  
  - Details: Internal warning Wrm heater

For further information on the heater system and the heater refer to separate <Heater system and heater> chapter.
Activate heater system monitoring

Heater system monitoring monitors all connected heaters for failure.

Required user level: Specialist (4).

Device configuration M0053
Monitoring functions M00645
Monitor heat. system M0647

Default value: Function not active

Setting values:

Function not active
Heater monitoring is deactivated.

Function active
Heater monitoring is activated.

Activate heater control unit monitoring

Information
If a heater system is installed within the actuator controls, heater monitoring is not activated/deactivated via this parameter, but via Monitor heat. system M0647 parameter of the heater system.

Required user level: Specialist (4).

Device configuration M0053
Actuator M0168
Heater monitor M0646

Default value: Function not active

Setting values:

Function not active
Heater monitoring is deactivated.

On
Heater monitoring is activated. If the heater fails, a warning will be issued.

Information
Monitoring can only be made once the heater is activated (parameter Heater control unit).

Set reaction time for heater monitoring

Heater monitoring will only respond once a fault persists longer than the set monitoring time. Short-time faults occurring for less than the set monitoring time are not signalled as warning.

Required user level: AUMA (6).

Device configuration M0053
Actuator M0168
Heating sys. mon. time M0859

Default value: 300.0 seconds

Setting range: 60 ... 3600 seconds (1 minute to 1 hour)

10.10. Verification of sub-assemblies

Conditions
- Actuators of the type range SA 07.2 – SA 16.2/SAR 07.2 – SAR 16.2
- MWG position transmitter in actuator

Characteristics
The controls verify whether sub-assemblies mounted in actuators and controls correspond to the desired version.

In case incorrect sub-assemblies are mounted or if sub-assemblies are missing the controls either send a warning or a fault signal.

For detailed information on this indication refer to <Fault signals and warnings> chapter.
10.11. Phase failure monitoring

**Conditions:** Phase failure monitoring is only valid for connections to 3-phase AC power supplies. For versions with 1-phase AC or DC, phase failure monitoring is not possible.

**Characteristics:** The AUMATIC monitors phase L2. If phase L2 is missing for a certain time interval, the AUMATIC still can send and receive signals and generates a fault indication. Since the AUMATIC is supplied via phases L1 and L3, the two phases cannot be monitored. In case L1 or L3 fails, the AUMATIC is inoperable and the actuator stops.

**Information:** In case of phase L2 loss during motor operation, this does not necessarily lead to an immediate standstill of the actuator. The reason is that the rotating motor generates the missing phase itself. This leads, however, to a reduction of the motor output torque. If the torque is sufficient for valve operation, the missing phase L2 is only detected when switching off (e.g. in an end position) and the fault signal *Phase fault* is generated.

**Configuration of the tripping time**

Required user level: Specialist (4) or higher.

M > Device configuration M0053  
Phase monitoring M0170  
Tripping time M0172  

Default value: 10.0 s  
Setting range: 1.0 – 300.0 s

**Information:** Faults in supply voltage (e.g. voltage drops) do not generate a fault signal during the adjustable tripping time.

10.12. Phase sequence detection and correction of the direction of rotation

**Conditions:** The phase sequence detection is only valid for connections to 3-phase AC power supplies. For versions with 1-phase AC or DC, phase sequence detection is not possible.

**Characteristics:** Exchanging any two phase conductors in the 3-phase mains changes the direction of phase rotation. Should the phases L1, L2 and L3 be connected in the wrong sequence, this is detected and corrected by the AUMATIC, preventing the actuator from turning into the wrong direction.

**Activate phase sequence detection and correction of direction of rotation**

M > Device configuration M0053  
Phase monitoring M0170  
Adapt rotary dir. M0171  

Default value: Function active  
Setting values:

- **Function active** Function <Phase sequence detection and correction of direction of rotation> is activated.
- **Function not active** Phase sequence detection and correction of direction of rotation is deactivated.
11. Functions: activate and enable

11.1. Activate functions

Via menu Activation M0212, functions can be switched on (activated) or off (deactivated).

Required user level for enabling/disabling: Specialist (4) or higher.

Device configuration M0053
Application functions M0178
Activation M0212

Information

Some functions require enabling. Only enabled functions are visible and can be activated or deactivated.

Information

In user level Specialist (4), an additional activation password (depending on the serial number) is required for enabling the function. The activation password can only be assigned and generated by the AUMA service.
12. Service functions

The functions described here may only be changed by the AUMA service or by authorised and trained personnel.

Menu item Service functions is only visible, if user level Specialist (4) or higher is selected.

12.1. Direction of rotation

Characteristics

This function allows changing the direction of rotation for actuator with 3-phase AC motors.

The direction of rotation indicates the direction into which the drive shaft rotates around its own axis. The view is on the top of the actuator. Distinction is made between clockwise and counterclockwise rotation.

Information

- When changing from clockwise closing to counterclockwise closing or vice versa, only the direction of rotation of the motor is changed. The change-over requires further action:
  - The wiring diagram designation is marked on the AUMATIC name plate. In case of a change, a new name plate with the new wiring diagram number has to be requested from AUMA.
  - The wiring diagram number is stored in the electronic device ID (parameter Wiring diagram actuator M0060). The ID has to be adapted to the new designation once the conversion is complete.
  - The actuator mounted to the controls must be configured for the set direction of rotation. Subsequent conversion from clockwise closing to counterclockwise closing is possible using an AUMA conversion kit.

Parameters and instructions for setting

Setting the direction of rotation using parameters is only possible for actuators with electronic control unit/MWG (Non-intrusive version).

Valve damage due to incorrect direction of rotation!

→ For 3-phase AC motors, the rotation direction of the actuator must match the rotation direction of the valve.

Required user level: AUMA (6).

M ➤ Device configuration M0053
    Actuator M0168
    Closing rotation M0176

Default value: Clockwise rotation

Setting values:

Clockwise rotation

The motor is controlled with a clockwise rotating field with the following sequence: L1-U1, L2-U2, L3-U3 (clockwise closing).

Counterclockwise rotation

The motor is controlled with a counterclockwise rotating field with the following sequence: L1-U3, L2-U2, L3-U1 (counterclockwise closing).

12.2. Factory setting

The factory setting corresponds to the delivery state of the AUMATIC.

When converting the controls e.g. by the AUMA service, a new factory setting can be generated to adapt the modified configuration.

Former factory settings can be restored.

Generate new factory setting

Required user level: Service (5) or higher.
### 12.3. Languages: reload

If texts are changed or if a new display language is available, the language file can be updated from the external data carrier (SD card).

- **Required user level:** Specialist (4) or higher.

### 12.4. Data export

During data export the data is saved from the device to an external data carrier (SD card).

#### Export data

Comprehensive export of all data (parameters, operation data and event protocol).

- Operation data is device-specific data.
- **Required user level:** Service (5) or higher.

### 12.5. Data import

During data import, the data is transmitted to the controls from an external data carrier (SD card).

#### Import parameters

- Import of all parameters. Operating data is not overwritten.
- **Required user level:** Specialist (4) or higher.
12.6. Actual configuration: accept

When retrofitting controls, sub-assemblies are replaced by new sub-assemblies with different functions.

Example: Replacing the PSU (different voltage).

If the controls detect a modified sub-assembly during start up, the following fault signal is generated: **Configuration error**

**Accept current actual configuration**

Accept new actual configuration as target configuration.

Required user level: AUMA (6).

12.7. Firmware update

A firmware update is required in the following cases:

- Upgrade with new functions
- Corrective actions

A firmware update can be performed in the following ways:

1. via Bluetooth connection using AUMA CDT software on a laptop computer or PDA
2. via an SD card (card slot in local controls)

**Firmware version**

The firmware version can be displayed via the following menu:

**Firmware update via SD card**

The menu **Update firmware** is only displayed if an SD card has engaged in the card slot of the local controls.

Required access level: Service (5) or higher.

12.8. Service software AUMA CDT (Bluetooth)

AUMA CDT is a user-friendly setting and operation program for AUMA actuator controls AC 01.2.

The connection between computer (PC, laptop, PDA) and local controls is established wireless via Bluetooth interface.

**Activate Bluetooth**

Required user level: Specialist (4) or higher.
Default value: **Function active**  
Setting values:  
Function deactivated.  
Function activated. If the connection is active, the blue LED on the local controls is illuminated.

### Addresses and device tag

Required user level: **Specialist (4)** or higher.

- Diagnostic: M0022  
- Bluetooth: M0244  
- Device tag: M0423  
- Bluetooth address: M0422  
- Bluetooth add.partner: M0576
13. Diagnostics

Diagnostics comprise information on the device and on device sub-assemblies for support during commissioning, maintenance or corrective action.

13.1. Electronic device ID

The electronic device ID provides information about the order data (important for enquiries with the factory).

**M**

**Device ID M0021**
**Identification M0026**
**Version M0062**

Information on device identifications can be modified with the appropriate rights (user level).

</tr>
</tbody>
</table>

13.11. Simulation (inspection and test function)

The service personnel or the commissioning engineer can use this simulation function to simulate the operation and failure behaviour of the actuator or the AUMATIC to check the interface to the DCS and the correct behaviour of the DCS.

13.11.1. Actuator signals

By simulating the actuator signals, the signal behaviour of the AUMATIC to the DCS can be tested, for example, without having to connect the actuator.

Required user level: Service (5) or higher.

M ▶ Diagnostic M0022

Simulation M0023

Actuator signals M0024
Simulation values:

- End position OPEN reached.
- End position CLOSED reached.
- Torque in direction OPEN reached.
- Torque in direction CLOSE reached.
- Motor protection tripped (thermal fault)

The simulation is activated and deactivated by push button **Ok**. A loop on the display indicates that the simulation is active.

### 13.11.2. Interface signals

By simulating the interface signals, the signal behaviour of the AUMATIC to the DCS can be tested, for example, without having to connect the actuator.

Required access level: **Specialist (4)** or higher.

#### M > Diagnostic M0022
- Simulation M0023
  - Signals DOUT M0025
  - Signals AOUT 1 M0413
  - Signals AOUT 2 M0585

#### Signals for simulating digital outputs:

Only the assigned outputs are displayed.

Numbers 1, 2, 3,... indicate the digital output.

**Example:** 1 Fault

- Indication **Fault** is assigned to digital output 1 (parameter **Signal DOUT 1 M0109**).
- Simulation is activated and deactivated by push button **Ok**.

Triangles indicate the activation:

<table>
<thead>
<tr>

</tbody>
</table>

#### Signals for simulating analogue outputs:

- **Signals AOUT 1**: Simulation of output signal **Actual position**, setting range: 0 ... 20 mA
- **Signals AOUT 2**: Simulation of output signal **Torque**, setting range: 0 ... 20 mA
14. Plant Asset Management

The <Asset Management> function provides information (operational data, signals, reports and characteristics), which can be used within an Asset Management System but also generally for support during commissioning, maintenance or corrective action.

14.1. Operating data

Operating data provides details e.g. about the running time, the number of starts, number of torque faults etc.

The analysis of this data provides valuable information regarding the optimization of both actuator and valve. When using this information purposefully, actuator and valve will be carefully operated, e.g. through appropriate parameter setting. In case of faults, the logging of operating data allows for quick fault diagnostic.

View the operating data

Two counters are available, a lifetime counter and a resettable counter.

Table 14: Operating data

  Operational info M0177
  Operational info total M0183
  Operational info M0188

Description of the indications:

- Operational info total = Lifetime counter
- Operational info = Counter can be reset to 0

Reset operation info M0197
The entries in the operating data logging can be reset (deleted) via this menu.

### 14.2. Event report

The event report records system events and status signals. The event record can be exported to the external SD card or read via AUMA CDT software. This allows conclusions on previous actuator and valve operations, for example.

**Information**

Since the events are recorded with a time-stamp, date and time (parameter Date and time M0221) should be properly set.

**Event filter for system events**

The AUMATIC records system events such as operation commands or modifications on the parameter settings. A filter is used to define the system events to be recorded in the event report.

Required user level: AUMA (6).

**Commands**

All operation commands recognised as valid and executed are recorded. The command source of the operation command is also recorded.

**Parameterization**

All modifications of parameter settings are also recorded. Both former and new value are recorded.

**Enable processes**

The enabling of a function is recorded.

**System events**

All important system events are recorded. These include: System start, change of date, downloads, modifications of the event filter, resetting of operating data and switching on the mains voltage.

**Event filter for status indications**

The AUMATIC records status indications such as faults, errors, warnings or Actuator is in end position CLOSED/OPEN. A filter is used to define the status indications to be recorded in the event report.

Required user level: AUMA (6).

**Events which can be recorded:**

The events which can be selected here are described in the <Faults and warnings> chapter.

**File size of event report**

The file size of the event report can be modified to record more or less events as desired. If the file is full, the oldest events will be overwritten so that the latest and current events are recorded.

Required user level: AUMA (6).
Number of events in the buffer

The events are first stored into an internal RAM. From this buffer, they are written to the event report after the set report cycle. The number of events in the buffer can be set here.

Information

In case of power failure, the events in the buffer will be lost.

Required user level: AUMA (6).

14.3. Characteristics

14.3.1. Torque-travel characteristic

Conditions

- Actuators with electronic control unit
- Actuator controls AC 01.2 (non-intrusive version) from firmware version 02.03.01

Characteristics

Representation of torque requirement across complete travel (resolution of 0.1 %)

During each travel, the controls continuously record the torques applied.

Application

When comparing two characteristics (current characteristic with archived characteristic), the wear within the valve or the actuator can be assessed.

Display torque-travel characteristics

3 characteristics with two diagrams each (direction OPEN and direction CLOSE) are displayed while the arrow indicates the operation direction diagram.

Each characteristic has a designation (e.g. _REF1_), which can be changed.

Use push buttons ▲▼ Up ▲ Down ▼ to change between characteristics.
Figure 58: Example of torque-time characteristic

--- Set tripping torque
--- Min. adjustable tripping torque
Diagram for direction CLOSE
Diagram for direction OPEN

The displayed characteristics are records which were previously saved. The following further information is saved with the characteristic (can be requested via push button Details):
- **Saving date**: Time of last torque measurement
- **Starting date**: Time of first torque measurement
- **Scaling**: Y-axis (torque)
- **Tripping torque**: Set torque in direction OPEN/CLOSE
- **Min tripping torque**: Min. adjustable tripping torque
- **Max. value**: Max. measured torque value
- **Mean value**: Calculated mean value

**Characteristics recording procedure**
1. Reset characteristics (clear buffer)
2. Change characteristic designation
3. Record characteristic: Perform operation (e.g. CLOSE-OPEN-CLOSE)
4. Save characteristic

**Reset characteristic**

This parameter is used to reset the data in the buffer (RAM). Required user level: Specialist (4) or higher.

**Change characteristic designation**

Each of the three characteristics can be named with an additional 20 characters. Required user level: Specialist (4) or higher.

**Record characteristic: Perform operation (e.g. CLOSE-OPEN-CLOSE)**

Set selector switch to position **Local control** (LOCAL) or **Remote control** (REMOTE) to record the characteristic.
Save characteristics

3 characteristics can be saved. Each characteristic consists of two charts (direction OPEN and direction CLOSE). When saving, data is transferred from the buffer (RAM) to the read-only memory (ROM).

Required user level: Specialist (4) or higher.

14.3.2. Position-time characteristic

Conditions
- Actuator of the type range SA 07.2 – SA 16.2/SAR 07.2 – SAR 16.2
- MWG position transmitter in actuator

Characteristics
During recording, the current position, for modulating actuators also the setpoint position, within an adjustable time interval (between 1 second and 1 hour).

Application
By assessing the position-time characteristics, the control behaviour can be assessed or insights on the use of the actuator can be gained.

Display position-time characteristics

The following further information is saved with the characteristic (can be requested via push button Details):
- Saving date: Time of last position measurement
- Starting date: Time of first position measurement
- Scaling: Y-axis (position)

Set resolution (time interval)

Actuator controls records 10,000 measured values Set resolution of e.g. approx. 1 second (parameter Interval position-time = 1 [s] ) results in a recording time of 2.7 hours (10 000 seconds). Once this value has been exceeded, the former positions will be overwritten (ring buffer).

Required user level: Specialist (4) or higher.
14.3.3. Temperature-time characteristic

Characteristics

Up to four temperature-time characteristics can be recorded unless the devices are fitted with suitable sensors.

Conditions

- For recording the temperature within the control unit: MWG (magnetic limit and torque transmitter)
- For recording the temperature within the motor: additionally temperature sensor (PT 100) in the motor
- For recording the temperature within the gear housing: additionally temperature sensor (PT 100) in the gearing

Application

Evaluation of the temperature-time characteristics allows to gain knowledge about the service conditions (ambient temperatures) of the actuator.

Display temperature-time characteristic

Asset Management M1231
Characteristics M0313
Temperature-time M0714

Up to four characteristics are shown in the display.

CONTROLSTEMPERATURE = temperature within the control unit
MWGTEMPERATURE = MWG temperature
MOTORTEMPERATURE = temperature within the motor
GEARTEMPERATURE = within the gear housing

Use push buttons Up ▲ Down ▼ to change between available characteristics.

Figure 60: Example of temperature-time (within the control unit)

--- 0°C line

Recording interrupted e.g. due to power failure

AC display shows temperature evolution during one week. AUMA CDT software reads out the evolution during an entire year.

The following further information is saved with the characteristic (can be requested via push button Details)

- Saving date: Time of last temperature measurement
- Starting date: Time of first temperature measurement
- Scaling: Y-axis (temperature)
- Min. value: Minimum measured value
- Max. value: Maximum measured value

14.4. Histograms

14.4.1. Motor running time-position (histogram)

Conditions

- Actuators of the type range SA 07.2 – SA 16.2/SAR 07.2 – SAR 16.2
Characteristics
The entire travel (from 0 – 100 %) is divided into 20 segments for recording the motor running time. When passing a segment, the counter, shown as bar graph, increments. The histogram is cyclically saved once a minute, in case a change has occurred.

Application
The motor running time position histogram shows the travel range within which the actuator is predominantly operated. This allows to draw conclusions for the sizing of the valve.

Display motor running time-position

14.4.2. Motor running time-temperature (histogram)

Conditions
- MWG position transmitter in actuator
- Temperature sensor in the motor (option)

Characteristics
The motor temperature is divided into the following segments:
< -20°C to -10°C, > -10°C to 0°C, > 0°C to 10°C, ..., 120°C to 130°C, > 130°C to 140°C.

During each operation, the counter of the segment corresponding to the current motor temperature will be incremented. The result is shown in a bar chart. The histogram is cyclically saved once a minute, in case a change has occurred.

Application
The histogram indicates the ambient conditions (temperatures) at which the actuator motor was predominantly operated.

Display motor running time-temperature

The following further information is saved with the histogram (can be requested via push button Details)
- Starting date: Date of first running time measurement
- Saving date: Date of last running time measurement
- Scaling: Y-axis (motor running time)
14.4.3. Acceleration-frequency (histogram)

**Conditions**
MWG position transmitter in actuator

**Characteristics**
The histogram show the percentage distribution of exceeded acceleration. Exceeding of the acceleration limits preset in the factory is recorded in ten different frequency ranges with 20 Hz each (0 – 20 Hz, ..., 180 – 200 Hz).

**Application**
The histogram indicates the frequency range within which the actuator was exposed to vibration for example (e.g. vibration with the pipeline). Impermissibly high or persisting vibration can destroy components of the actuator.

**Display acceleration-frequency**

M ► Asset Management M1231
Histograms M0712
Acceleration-frequency M0716

Figure 63: Example of acceleration-frequency histogram

The following further information is saved with the histogram (can be requested via push button Details)

- **Starting date**: Date of first measurement
- **Saving date**: Date of last measurement
- **Scaling**: Y-axis (acceleration)

14.4.4. Motor running time-torque (histogram)

**Conditions**
MWG position transmitter in actuator

**Characteristics**
The torque scale is divided into the following segments for both directions (OPEN/CLOSE):
- from 0 – 30 %
- from 30 – 110 % (8 segments with a width of 10 % each)
- more than 110 %

During each operation, the counter of the segment corresponding to the currently required torque will be incremented. The result is shown in a bar chart. The histogram is cyclically saved once a minute, in case a change has occurred.

**Application**
The motor running time-torque histogram indicates the actuator load during service life.

**Display motor running time-torque**

M ► Asset Management M1231
Histograms M0712
Motor run.time-torque M0830

Figure 64: Example of motor running time-torque histogram

The following further information is saved with the histogram (can be requested via push button Details)
### 14.5 Maintenance (information and signals)

#### Characteristics
AC actuator controls monitor various parameters set in the factory which have an impact on the wear of the actuator. Once one of these parameters exceeds a determined limit, actuator controls generate a signal:

- **Status indication:** S0005 Warnings (AUMA category)
  - Details: Maintenance required
- **Status indication:** S0010 Maintenance required (NAMUR category)
  - Details: shows the parameter(s) for which the limit was exceeded, causing the Maintenance required signal.

Apart from the parameter monitoring preset in the factory (MT lifetime mechanics/O-rings/lubricant/contactors), a fixed maintenance interval can additionally be configured, triggering the same signal when exceeding the configured time.

The current maintenance status of the monitored parameters is represented in a bar chart.

Once maintenance is complete, the parameter initiating maintenance must be reset to zero.

#### Application
Maintenance on demand, i.e. the function can be used to perform maintenance depending on the intensity and load of the actuator.

<table>
<thead>
<tr>
<th>Activate maintenance signals</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required user level:</strong> Specialist (4) or higher.</td>
</tr>
</tbody>
</table>

**Default value:** Function not active

**Setting values:**
- **Function not active** <Maintenance signals> function deactivated.
- **Function active** <Maintenance signals> function activated.

<table>
<thead>
<tr>
<th>Activate &lt;Maintenance interval&gt; function</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Required user level:</strong> Specialist (4) or higher.</td>
</tr>
</tbody>
</table>

**Default value:** Function not active

**Setting values:**
- **Function not active** <Maintenance interval> function deactivated.
- **Function active** <Maintenance interval> function activated.

<table>
<thead>
<tr>
<th>Display maintenance information</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th><strong>M</strong></th>
</tr>
</thead>
<tbody>
<tr>

</tr>
<tr>
<td>Activation M0212</td>
</tr>
<tr>
<td>Maintenance signals M1136</td>
</tr>
<tr>
<td><strong>Default value:</strong> Function not active</td>
</tr>
</tbody>
</table>

**Setting values:**
- **Function not active** <Maintenance interval> function deactivated.
- **Function active** <Maintenance interval> function activated.
Figure 65: Example of bar chart

The bar charts indicates the current consumption of the following lifetime accounts:

- Lifetime mechanics
- Lifetime seals (O-rings)
- Lifetime lubricants
- Lifetime contactors
- Maintenance interval (adjustable)

Once a bar reaches the threshold (- - - ), maintenance will be required.

**Reset parameter**

Once maintenance is complete, the parameter initiating the maintenance must be reset.

Starting from Maintenance informat. M1037 indication, you can change via Edit to the reset mode.

Required user level: Specialist (4) or higher.

**Device configuration** M0053
- Application functions M0178
- Activation M0212

Figure 66:

Use push buttons Up ▲ Down ▼ to select the desired parameter. The arrow below the symbols shows the selected parameter. Pressing push button Reset resets the lifetime account of the selected parameter to zero.

**Set maintenance interval**

Parameters for setting a defined maintenance interval. Once the set time has elapsed, a maintenance signal is issued.

Required user level: Specialist (4) or higher.

**Maintenance signals** M1231
- Maintenance M1644
- Maintenance interval M1233

Default value: 10 years
Setting range: 1 month... 10 years

**View/set mechanics setting values**

The lifetime of the mechanics depends on the number of starts of the actuator. If an MWG is installed in the actuator, the number of completed turns including torque present will also be accounted for.
14.6. Operating times: display

**Characteristics**
The actuator controls automatically determine the operating time for an operation between two end positions. For both directions (from OPEN to CLOSE and from CLOSE to OPEN), the last determined value is saved within a parameter.

**Application**
Operating time measurement indicated how an actuator installed in plant or a combination of actuator/gearbox-valve behave with regard to inertia without performing an operation and measuring the time manually.

**Display measured operating times**

<table>
<thead>
<tr>
<th>Indication</th>
<th>Definition</th>
</tr>

</tbody>
</table>

14.7. Device temperatures: display

**Indications:**
- Temp. controls
  - Indication of current temperature in controls housing
- Temp. control unit
  - Indication of current temperature in control unit of the actuator (actuator housing)
15. Corrective action

15.1. Primary fuses

The AUMATIC has to be opened to replace the primary fuses. For detailed information, refer to operation instructions for actuator.

15.2. Fault indications and warning indications

Faults interrupt or prevent the electrical actuator operation. In the event of a fault, the display backlight is red.

Warnings have no influence on the electrical actuator operation. They only serve for information purposes.

Collective signals include further indications which can be displayed via the Details push button.

<th>Remedy</th>
</tr>
</thead>
</table>
| **Mains quality**     | Due to insufficient mains quality, the controls cannot detect the phase sequence (sequence of phase conductors L1, L2 and L3) within the pre-set time frame provided for monitoring. | • Check mains voltage.  
• Check parameter **Tripping time M0172** extend time frame if required. |
| **Thermal fault**     | Motor protection tripped | • Cool down, wait.  
• If the fault indication display persists after cooling down:  
  - Set selector switch to position **Local control** (LOCAL) and reset fault indication via push button **RESET**.  
  - Check fuses. |
| **Fault no reaction** | No actuator reaction to operation commands within the set reaction time. | Check movement at actuator. |

</tr>
</tbody>
</table>

**LPV (Lift Plug Valve) synchronisation signal. Master or slave actuator are in an end position.**

**LPV SA:OPEN**

Operation command in direction OPEN from the master actuator to the slave actuator (SA).

**LPV SA:CLOSE**

Operation command in direction CLOSE from the master actuator to the slave actuator (SA).

**PVST required**

(PVST) Partial Valve Stroke Test should be executed

**FQM FS ready**

FQM (fail safe) ready

**FQM request**

The fail safe function of the FQM (Fail safe) is active.

**FQM end pos: open**

FQM has reached end position OPEN at the output drive side.

**FQM end pos: closed**

FQM has reached end position CLOSED at the output drive side.

### 16.2. Selection overview of binary signals for digital inputs (DIN)

Depending on the version, the AC is equipped with up to 10 digital inputs. The inputs are designed for binary signals (standard input level: +24 V DC) and can be used, for example, to receive operation commands OPEN, STOP, CLOSE, to control intermediate positions or for the EMERGENCY signal.
